----- Summary Statistics  
Center project name: M BB0361P07

**NOTICE:** This sequence may not represent the entire insert of this clone. It may be shorter because we only sequence overlapping clone sections once, or longer because we provide a small overlap between neighboring data submissions.

This sequence was finished as follows unless otherwise noted: all regions were double stranded, sequenced with an alternate chemistry, or covered by high quality data (i.e., phred quality  $\geq 30$ ); an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by sequence from more than one subclone; and the assembly was confirmed by restriction digest.

**MAPPING INFORMATION:**  
Mapping information for this clone was provided by Dr. Wes Warren, Department of Genetics, Washington University, St. Louis MO. For additional information about the map position of this sequence, see <http://genome.wustl.edu>

**SOURCE INFORMATION:**  
The RPCI-24 BAC Library has been constructed by Pieter de Jong and coworkers (<http://www.chori.org>) from male C57BL/6J mouse spleen and/or brain genomic DNA. The clone and detailed information can be obtained from Pieter de Jong and coworkers at <http://www.chori.org>

NEIGHBORING SEQUENCE INFORMATION:  
This sequence is the entire insert of the clone.

----- Summary Statistics
-----
Center project name: M_BA0174122
-----

NOTICE:
This sequence was finished as follows unless otherwise noted:
all regions were double stranded, sequenced with an alternate
chemistry, or covered by high quality data (i.e., phred quality >=
30); an attempt was made to resolve all sequencing problems, such
as compressions and repeats; all regions were covered by sequence
from more than one subclone; and the assembly was confirmed by
restriction digest.

```

MAPPING INFORMATION:  
Mapping information for this clone was provided by Dr. Wes Warren, Department of Genetics, Washington University, St. Louis MO. For additional information about the map position of this sequence, see <http://genome.wustl.edu>

## SOURCE INFORMATION:

The RPCI-23 BAC Library has been constructed by Kazutoyo Oseawa and Minako Tatenio in the laboratory of Pieter de Jong (<http://www.chori.org>) from female C57BL/6J mouse kidney and/or brain genomic DNA. The clone and detailed information can be obtained from Research Genetics, Inc. (<http://www.resgen.com>) or Pieter de Jong and coworkers at <http://www.chori.org>

## NEIGHBORING SEQUENCE INFORMATION:

This sequence is the entire insert of the clone.

Pred. No. is the number of results predicted by chance to have a  
score greater than or equal to the score of the result being printed,  
and is derived by analysis of the total score distribution.

 XX Claim 1; Page 36; 44pp; English.  
 PS The invention relates to a method of detecting Mycobacterium species,  
 CC that involves amplifying Mycobacterium 16S ribosomal RNA (rRNA) or DNA  
 CC encoding 16S rRNA in an in vitro nucleic acid amplification mixture  
 CC comprising a polymerase, and at least two primers, and then detecting the  
 CC amplified nucleic acid. The method is relatively simple and useful for  
 CC detecting the presence of various Mycobacterium species in a biological  
 CC sample, and thus important for diagnosis of infections resulting from  
 CC them. The method is especially important for screening opportunistic  
 CC infections caused by M. tuberculosis or a Mycobacterium other than  
 CC tuberculosis (MOTT). The present sequence is a PCR primer used for  
 CC amplifying Mycobacterium 16S rRNA

 PT Decomposing formaldehyde by Mycobacterium and/or growth medium of the  
 PT cells.  
 XX  
 PS Example 1; SEQ ID NO 1; 20pp; Japanese.  
 XX  
 CC The invention relates to a novel method for decomposing formaldehyde by  
 CC using microbial cells that belong to Mycobacterium sp. or Fusarium  
 CC oxysporum, and/or the growth medium of the microbial cells. The invention  
 CC further comprises: microbial cells which belong to Mycobacterium sp.  
 CC having the ability to decompose formaldehyde; a formaldehyde  
 CC decomposition agent comprising Mycobacterium sp. and/or the growth medium  
 CC of the microbial cells; and a formaldehyde decomposition agent comprising  
 CC F. oxysporum and/or its growth medium. The method is useful for  
 CC decomposing formaldehyde in sea water by Mycobacterium sp. or F.  
 CC oxysporum that is deposited under FERM P-S18690 or FERM P-18483,  
 CC respectively. This polynucleotide sequence represents the Mycobacterium  
 CC sp. DNA of the invention.

 CC The invention relates to a method (M1) for determining a bacterium  
 CC species. (M1) comprises: (a) culturing a bacterium from a specimen; (b)  
 CC extracting a genomic nucleotide from the bacterium to provide a  
 CC nucleotide template; (c) annealing a region of a nucleotide template to a  
 CC specific oligonucleotide primer set comprising SEQ-FOR and SEQ-REV in a  
 CC complimentary fashion, the primer set designed to provide a product

CC having a predetermined size dictated by a complementary primer set; (d)  
 CC amplifying the region of the nucleotide template to produce the product;  
 CC and (e) determining a species of a bacterium in a nucleotide sequence of  
 CC the product. Also described is an alternative method (M2) for determining  
 CC a bacterium species comprising: (a) providing a specimen or a sample  
 CC having a template; (b) providing a pair of primers selected from: (i) a  
 CC first forward primer having consecutive bases of an AFB-f comprising any  
 CC of the 36 sequences of 15-22 bp (AEA22417-AEA22452), or their fragments  
 CC or variations and a first reverse primer having consecutive bases of an  
 CC AFB-r comprising any of the 36 sequences of 15-22 bp (AEA22453-AEA22488)  
 CC or their fragments or variations; (ii) a second forward primer having  
 CC consecutive bases of an UB-f comprising any of the 28 sequences of 15-21  
 CC bp (AEA22489-AEA22516) or their fragments or variations and a second  
 CC reverse primer having consecutive bases of an UB-r comprising any of the  
 CC 28 sequences of 15-21 bp (AEA22517-AEA22544) or their fragments or  
 CC variations; or (iii) a first forward primer having consecutive bases of  
 CC an AFB-f of AEA22417-AEA22452 or their fragments or variations and a  
 CC second reverse primer having consecutive bases of an UB-r of AEA22517-  
 CC AEA22544 or their fragments or variations; (c) the specimen; and (d)  
 CC comparing the product from the specimen with a nucleotide sequence from a  
 CC database to determine the bacterium species present in the specimen. The  
 CC methods are useful for determining a bacterium species. The present  
 CC sequence represents a Mycobacterium fortuitum 16S rRNA nucleotide  
 CC sequence, which is used in the exemplification of the present invention.

PT 20-100 base probes derived from V1, V2 or V3 regions of 16S rRNA of a  
 PT microorganism for specific detection and identification of the  
 PT microorganism in foods and drug compositions.

XX Claim 2; SEQ ID NO 150; 150pp; Japanese.

XX The present invention relates to probes (ADF93908-ADF94059) for the  
 CC specific detection and identification of harmful microorganisms in  
 CC samples of foods and drug compositions. The probe sequences are derived  
 CC from the V1, V2 and/or V3 regions of the 16S rRNA of the microorganism,  
 CC or its complementary sequence. Detection and identification of the  
 CC microorganism is by amplification of the complete 16S rRNA gene using  
 CC primers ADF94060 and ADF94061, labelling the amplification product (a  
 CC fluorescence label is preferred) and hybridising to the probe or probes  
 CC of the invention. The probes may be immobilised on a DNA chip. The  
 CC microorganism is selected from *Actinobacillus actinomycetemcomitans*,  
 CC *Acinetobacter calcoaceticus*, *Haemophilus influenzae*, *Stenotrophomonas*  
 CC *malophilia*, *Proteus mirabilis*, *Streptococcus pneumoniae*, *Pseudomonas*

XX Novel Streptomyces sp. produced polypeptide for hydroxylation of  
 PT compactin at 6beta-position and its encoded DNA, applicable in  
 PT constructing transformant microbes to synthesize pravastatin for treating  
 PT hyperlipidemia.

PS Disclosure; Page 50-51; 67pp; Japanese.

XX The present invention describes a DNA sequence which contains a base  
 CC sequence from bases 544-1758 in the sequence of (I) with 1992 base pairs,  
 CC or a DNA hybridisable with the DNA under stringent conditions and  
 CC encoding a polypeptide with hydroxylase activity on compactin at 6beta-  
 CC position. Also described: (1) DNA containing base sequences from bases  
 CC 544-1758 and from bases 1782-1970 in the sequence of (I) or a DNA  
 CC hybridisable with the DNA under stringent conditions and encoding a

CC polypeptide with hydroxylase activity on compactin at the 6beta-position;  
CC (2) a polypeptide encoded by any of the DNA or containing an amino acid  
CC sequence based on the polypeptide but with some amino acids deleted,  
CC substituted or added and having hydroxylase activity on compactin at the  
CC 6beta-position; (3) a recombinant DNA obtained by integrating with any of  
CC the DNA; (4) a microorganism transferred with the recombinant DNA; (5) a  
CC process for producing pravastatin by culturing the transformant  
CC microorganism before isolating the culture liquor or cells, and addition  
CC of compactin for reaction to give pravastatin for recovery; and (6)  
CC Streptomyces sp. TM-6 (FERM BP-8002) or TM-7 (FERM BP-8003). (I) has  
CC antilipaeamic activity. The polypeptide and its encoded DNA are applicable  
CC in constructing transformant microorganisms to synthesise pravastatin for  
CC treating hyperlipidaemia. With the recombinant microorganisms,  
CC pravastatin can be produced efficiently, with much less 6alpha  
CC hydroxylated epimer formed. The present sequence represents a  
CC Microtetraspora recticatenata IF014525 nucleotide sequence, which is given  
CC in the exemplification of the present invention

PT cyclosporin A in presence of Dactylosporangium and extracting cyclosporin  
PT derivative.  
XX  
XX Disclosure; SEQ ID NO 2; 12pp; Japanese.  
PS  
XX The invention relates to a novel method for producing a cyclosporin  
CC derivative. The method involves incubating cyclosporin A in the presence  
CC of a strain belonging to Dactylosporangium, Streptomyces, Nocardia,  
CC Pseudonocardia or Streptosporangium or its cultured microbial cells and  
CC extracting the cyclosporin derivative from the incubated liquid. The  
CC cyclosporin derivative is used as a reference standard for quantitative  
CC measurement of cyclosporin A and its metabolite in blood and urine. This  
CC polynucleotide represents a Streptosporangium 16S rDNA sequence used in  
CC the cyclosporin production method of the invention.

XX
XX Improving plant productivity comprises introducing into the plant or
XX propagation material an endophytic actinomycete that facilitates
XX induction of at least one characteristic related to improved
XX productivity.
XX
XX Claim 1; SEQ ID NO 16; 235pp; English.
XX
XX This invention relates to a novel method for improving plant
XX productivity. Specifically, it refers to introducing into the plant or
XX propagation material an endophytic actinomycetes or variant thereof,
XX where the actinomycetes facilitate induction of a characteristic related
XX to improved productivity. The present invention further describes
XX metabolites of the actinomycetes microorganism such as auxin, gibberellin
XX or cytokinin that are able to induce disease resistance in plants i.e.
XX provide disease bio-control capabilities against pathogen infection.
XX Accordingly, the method facilitates the improvement of cereal crop
XX productivity including increasing germination by up-regulating plant
XX growth promoting activities, as well as improving plant vigor or flower
XX and fruit yield. Furthermore, the new actinomycete or metabolite is
XX useful in the manufacture of a medicament for the therapeutic and/or
XX prophylactic treatment of a mammalian or non-mammalian subject i.e.
XX plant. As such, this method provides plant protectants and plant growth
XX stimulants that exhibit antibacterial, antimicrobial, fungicide,
XX insecticide and nematocide activities. This polynucleotide is the DNA
XX sequence of an actinomycetes 16S ribosomal RNA sequence of the invention.

PT Determining a bacterium species comprises providing oligonucleotide
PT primer set comprising SEQ-FOR and SEQ-REV in a complimentary fashion.
XX
PS Disclosure; SEQ ID NO 7; 74pp; English.
XX
CC The invention relates to a method (M1) for determining a bacterium
CC species. (M1) comprises: (a) culturing a bacterium from a specimen; (b)
CC extracting a genomic nucleotide from the bacterium to provide a
CC nucleotide template; (c) annealing a region of a nucleotide template to a
CC specific oligonucleotide primer set comprising SEQ-FOR and SEQ-REV in a
CC complimentary fashion, the primer set designed to provide a product
CC having a predetermined size dictated by a complimentary primer set; (d)
CC amplifying the region of the nucleotide template to produce the product;
CC and (e) determining a species of a bacterium in a nucleotide sequence of
CC the product. Also described is an alternative method (M2) for determining
CC a bacterium species comprising: (a) providing a specimen or a sample
CC having a template; (b) providing a pair of primers selected from: (i) a
CC first forward primer having consecutive bases of an APB-f comprising any
CC of the 36 sequences of 15-22 bp (AEA22417-AEA22452), or their fragments
CC or variations and a first reverse primer having consecutive bases of an
CC APB-r comprising any of the 36 sequences of 15-22 bp (AEA22453-AEA22488)
CC or their fragments or variations, (ii) a second forward primer having
CC consecutive bases of an UB-f comprising any of the 28 sequences of 15-21
CC bp (AEA22489-AEA22516) or their fragments or variations and a second
CC reverse primer having consecutive bases of an UB-r comprising any of the
CC 28 sequences of 15-21 bp (AEA22517-AEA22544) or their fragments or
CC variations, or (iii) a first forward primer having consecutive bases of
CC an APB-f of AEA22417-AEA22452 or their fragments or variations and a
CC second reverse primer having consecutive bases of an UB-r of AEA22517-
CC AEA22544 or their fragments or variations; (c) the specimen; and (d)
CC comparing the product from the specimen with a nucleotide sequence from a
CC database to determine the bacterium species present in the specimen. The
```

```
CC methods are useful for determining a bacterium species. The present
CC sequence represents a Mycobacterium gordonae 16S rRNA nucleotide
CC sequence, which is used in the exemplification of the present invention.

XX
XX Novel antibiotics isolated from fermentation broth of novel strain of
XX Microbispora corallina, useful for treating a wide range of bacterial
XX infections.
XX
XX Disclosure; SEQ ID NO 1; 20pp; English.
XX
XX The invention relates to antibiotic MF-BA-1768alpal or MF-BA-1768-betal
XX or its pharmaceutically acceptable salt, having physicochemical
XX characteristics in the non-salt form as detailed in the specification.
XX The antibiotics are isolated from a novel strain of Microbispora
XX corallina designated NRRL 30420. Also included are producing the above
XX antibiotic (by cultivating Microbispora corallina NRRL 30420, or an
XX antibiotic MF- BA-1768alpal or MF-BA-1768betal -producing mutant,
XX variant or its recombinant form, in a culture medium containing
XX assimilable sources of carbon, nitrogen and inorganic salts under aerobic
XX fermentation conditions until the antibiotic is produced and then
XX recovering the antibiotic) and a composition comprising the above
XX antibiotic or its salt. The antibiotics are useful for treating a
XX bacterial infection caused by Staphylococcus (e.g. S.aureus , S.epidermis
XX , S.haemolyticus ), Enterococcus (e.g. E.faecalis , E.faecium ),
XX Streptococcus (e.g. S.pneumoniae , S.pyrogenes ), Haemophilus (e.g.
XX H.influenzae ) or Escherichia (e.g. E.coli ) in a patient. The present
XX sequence is partial 16S rRNA sequence from M. corallina NRRL 30420, which
XX identifies the strain.

XX Claim 11; Page 27; 27pp; English.
XX
CC The present invention relates to a method for detecting Mycobacterium
CC avium complex (MAC) organisms (eg. M. avium, M. intracellulare, M.
CC tuberculosis, M. paratuberculosis) present in a biological sample. The
CC method comprises amplifying a 16S ribosomal RNA (rRNA) or DNA encoding
CC 16S rRNA obtained from a biological sample containing nucleic acid from a
CC MAC species in an in vitro nucleic acid amplification mixture comprising
CC a polymerase activity and a pair of primers to produce an amplified
CC nucleic acid and detecting amplified nucleic acid. The method is useful
CC for in vitro diagnostic detection of pathogenic bacteria, particularly
CC detecting infections caused by MAC organisms, distinguished from other
CC closely-related Mycobacterium species. The present sequence is a probe
CC used to detect amplified MAC 16S rRNA sequence or DNA encoding 16S rRNA

XX  
 PT Detection of mycobacteria by shift mobility assay.

XX  
 PS Disclosure; Fig 7; 20pp; English.

XX The invention describes a new method for diagnosis, identification and  
 CC characterisation of Mycobacterium tuberculosis or any other mycobacteria  
 CC by using polymerase chain reaction (PCR) and shift mobility assay (SMA)  
 CC in urea-polyacrylamide gel (UPAGE) comprises culturing, DNA extraction,  
 CC DNA amplification and shift mobility assay. The method is based on  
 CC divergence in sequences found in 16S rRNA to identify mycobacteria  
 CC species, since a remarkable shift of heteroduplex bands are obtained  
 CC between single stranded and homoduplex bands in UPAGE. The method is  
 CC fast, simple and can produce information not easily obtained when  
 CC compared with other detection methods. The sensitivity of other assays  
 CC suffer due to the tendency of the denatured PCR product strands to  
 CC reassociate and exclude oligonucleotide probes, and steric interference  
 CC between the bound oligonucleotides and the solid support which impede  
 CC hybridization to nucleic acids in solution. Sequences AAX99193-237  
 CC represent 16S rRNA gene regions of some mycobacterial species

XX
XX Method for stabilizing and storing reaction reagents for specific
XX amplification and detection of nucleic acids particularly in e.g.
XX identifying pathogenic microorganisms or viruses in sample.
XX
XX Example 15; Page 109; 177pp; Japanese.
XX
XX The invention relates to a novel stabilising reaction reagent for use in
XX the amplification and/or detection of a target nucleic acid comprising:
XX preparing a reaction mixture with e.g. a nucleic acid as template, at
XX least 1 primer and RNaseH; and incubation of the reaction mixture for a
XX defined period of time to form a reaction product during the
XX amplification of such target nucleic acid. The method is useful for
XX stabilising and long-term storage of reaction reagents for highly
XX sensitive and specific amplification and detection of nucleic acids
XX particularly in identifying pathogenic microorganisms or viruses in a
XX sample using chimeric oligonucleotide primers, which is useful in genetic
XX engineering and clinical medicine. This polynucleotide sequence
XX represents an oligo relating to the novel stabilising reaction reagent
XX method of the invention

XX
XX The invention relates to a method (M1) for determining a bacterium
XX species (M1) comprises: (a) culturing a bacterium from a specimen; (b)
XX extracting a genomic nucleotide from the bacterium to provide a
XX nucleotide template; (c) annealing a region of a nucleotide template to a
XX specific oligonucleotide primer set comprising SEQ-FOR and SEQ-REV in a
XX complementary fashion, the primer set designed to provide a product
XX having a predetermined size dictated by a complementary primer set; (d)
XX amplifying the region of the nucleotide template to produce the product;
XX and (e) determining a species of a bacterium in a nucleotide sequence of
XX the product. Also described is an alternative method (M2) for determining
XX a bacterium species comprising: (a) providing a specimen or a sample
XX having a template; (b) providing a pair of primers selected from: (i) a
XX first forward primer having consecutive bases of an AFB-f comprising any
XX of the 36 sequences of 15-22 bp (AEA22417-AEA22452), or their fragments
XX or variations and a first reverse primer having consecutive bases of an
XX AFB-r comprising any of the 36 sequences of 15-22 bp (AEA22453-AEA22489)
XX or their fragments or variations, (ii) a second forward primer having
XX consecutive bases of an UB-f comprising any of the 28 sequences of 15-21
XX bp (AEA22489-AEA22516) or their fragments or variations and a second
XX reverse primer having consecutive bases of an UB-r comprising any of the
XX 28 sequences of 15-21 bp (AEA22517-AEA22544) or their fragments or
XX variations, or (iii) a first forward primer having consecutive bases of
XX an AFB-f of AEA22417-AEA22452 or their fragments or variations and a
XX second reverse primer having consecutive bases of an UB-r of AEA22517-
XX AEA22544 or their fragments or variations; (c) the specimen; and (d)
XX comparing the product from the specimen with a nucleotide sequence from a
XX database to determine the bacterium species present in the specimen. The
XX methods are useful for determining a bacterium species. The present
XX sequence represents a Mycobacterium lentiflavum 16S rRNA nucleotide
XX sequence, which is used in the exemplification of the present invention.

PT Depleting or isolating targeted nucleic acids e.g. rRNA, involves using a
PT bridging oligonucleotide comprising bridging region and a targeting
PT region complementary to a targeted nucleic acid, and a capture
PT oligonucleotide.
XX
PS Claim 4; Page 168; 208pp; English.
XX
CC This invention relates to a novel method for isolating, depleting or
CC separating a targeted nucleic acid, such as rRNA, from a sample
CC comprising targeted and non-targeted nucleic acids. It effects a way of
CC enriching for non-targeted nucleic acids such as mRNAs. Isolating
CC sufficient quantities of high quality bacterial mRNA is a demanding
CC process which impedes analysis of bacterial gene expression in the
CC presence of host cells. A small percentage of bacterial mRNAs may be poly
CC -A tailed, but these are targeted for degradation and tend to be
CC unstable. As a result, the commonly employed method for mRNA purification
CC with eukaryotic cells, oligo-dT capture, is ineffective. The present
CC invention provides an alternative, more suitable method for mRNA
CC purification from prokaryotes. The method of the invention comprises the
CC incubation of a sample with a bridging oligonucleotide (containing a
CC targeting region) and subsequently incubating with a capture
CC oligonucleotide allowing the isolation of the target from the sample. The
CC method is useful for depleting or isolating targeted nucleic acid, for
CC example rRNA such as prokaryotic 16S or prokaryotic 23S, eukaryotic 17S
CC or 18S or eukaryotic 28S rRNA, from a sample. The rRNA sequence may
CC comprise any one of 64 fully defined sequences as given in the
CC specification. The present sequence is that of a DNA sequence which
CC represents the sequence of 16S rRNA of Mycobacterium avium related to the
CC invention.

Detecting Mycobacterium species, involves in vitro amplification of 16S
rRNA or DNA encoding RNA in nucleic acid amplification mixture using
specific primers, and detecting the amplified nucleic acid.
Claim 1; Page 36; 44pp; English.
The invention relates to a method of detecting Mycobacterium species,
that involves amplifying Mycobacterium 16S ribosomal RNA (rRNA) or DNA
encoding 16S rRNA in an in vitro nucleic acid amplification mixture
comprising a polymerase, and at least two primers, and then detecting the
amplified nucleic acid. The method is relatively simple and useful for
detecting the presence of various Mycobacterium species in a biological
sample, and thus important for diagnosis of infections resulting from
them. The method is especially important for screening opportunistic
infections caused by M. tuberculosis or a Mycobacterium other than
tuberculosis (MOTT). The present sequence is a PCR primer used for
amplifying Mycobacterium 16S rRNA

PT Detecting Mycobacterium species (e.g. Mycobacterium tuberculosis) present
PT in a biological sample, comprises using in vitro nucleic acid
PT amplification and detection of amplified products.
```

```
XX Claim 8; SEQ ID NO 23; 21pp; English.
XX
CC The present invention relates to a method of detecting Mycobacterium
CC species present in a biological sample. The method involves using in
CC vitro nucleic acid amplification and detection of amplified products. The
CC invention is useful for diagnostic detection of pathogenic bacteria such
CC as Mycobacterium species. The present sequence is the Mycobacterium
CC celatum (ATCC 51130 and ATCC 51131) 16S ribosomal RNA (16SrRNA)
CC amplifying non-T7 PCR primer.

PT New single-stranded oligonucleotide, useful for amplifying the nucleic
PT acid of Mycobacterium avium, Mycobacterium intracellulare, and
PT Mycobacterium kansasii.
XX
PS Claim 1; SEQ ID NO 13; 14pp; Japanese.
XX
CC The invention relates to a novel single-stranded oligonucleotide used in
CC a detection method of an atypical mycobacteria group. The invention
CC further includes: amplifying the nucleic acid of Mycobacterium avium by a
CC loop-mediated isothermal amplification (LAMP) method; amplifying the
CC nucleic acid of M. intracellulare by a LAMP method; amplifying the
CC nucleic acid of M. kansasii by a LAMP method; and a kit for detecting the
CC nucleic acid of M. avium by a LAMP method; detecting the nucleic acid of
CC M. intracellulare by a LAMP method; or detecting the nucleic acid of M.
CC kansasii by a LAMP method. The single-stranded oligonucleotide is useful
CC in medical applications. This oligo sequence represents a loop-mediated
CC isothermal amplification (LAMP) primer used in the exemplification of the
CC invention.

XX Fragments of Corynebacterium 16S RNA - useful as probes and primers for
XX identifying Corynebacterium spp.
XX
XX Claim 1; Fig 1; 60pp; French.
XX
XX Fragments covering 90 % of the sequence of 16S ribosomal RNA were
XX amplified from 28 strains of 25 different species of Corynebacterium by
XX PCR using primers specific for eubacteria. The amplification products
XX were sequenced and the sequences were aligned for comparison. It was
XX found that certain regions, i.e. those corresponding to nucleotides 72-
XX 100, 195-215, 466-494, 608-853, 838-853, 859-875 and 1013-1033 in the 16S
XX ribosomal RNA of C. diphtheriae (refer to features table for the present
XX

CC sequence), vary considerably between different species. Probes and
CC primers comprising at least 5 nucleotides from one of these species-
CC specific sequences, including the present sequence, or their complements,
CC are useful to distinguish between different Corynebacterium species. DNA
CC versions of the probes and primers are also included

XX
XX New abysomicin polycyclic macrolactone compounds, useful as antibiotics
XX and antiprotozoal agents effective against multiresistant strains,
XX prepared using bacteria of genus Verrucosisspora.
XX
XX Disclosure; SEQ ID NO 1; 47pp; German.
XX
XX This invention describes novel polycyclic macrolactones and their
XX derivatives , prepared using bacteria of genus Verrucosisspora and
XX designated abysomicins. The polycyclic macrolactones have at least one
XX oxa-bicyclo system as a partial structure and at least one Michael system
XX as double bond system. The polycyclic macrolactones are prepared by
XX culturing Verrucosisspora strain AB 18-032, recovering a culture
XX supernatant from the culture, optionally preparing a culture filtrate and
XX optionally isolating one or more polycyclic macrolactones from the
XX supernatant and/or filtrate. Alternatively the microorganism is cultured
XX followed by isolating one or more polycyclic macrolactones from the
XX microorganism. The Verrucosisspora strain AB 18-032 was isolated from
XX marine sediment collected at a depth of 1000m in Sagami bay in the
XX Japanese Sea and is deposited as DSM No. 15899. The polycyclic
XX macrolactones inhibit the biosynthesis of p-Aminobenzoic acid, (an
XX essential component in the biosynthesis of folic acid) from chorismic
XX acid, thus inhibiting folic acid biosynthesis. The vitamin folic acid is
```

CC essential to the life of microorganisms, especially prokaryotes and  
 CC protozoa. The polycyclic macrolactones do not inhibit the biosynthesis of  
 CC folic acid in mammals (including humans), and thus have no adverse  
 CC effects on mammalian cells. Three polycyclic macrolactones are  
 CC specifically claimed, i.e. abyssomicin B, abyssomicin C and abyssomicin  
 CC D. Abyssomicin C strongly inhibited growth of methicillin-resistant  
 CC *Staphylococcus aureus* strain N35 and vancomycin-resistant *Staphylococcus*  
 CC *aureus* strain Mu50. The products of the invention are useful as  
 CC antibiotics (especially effective against Gram positive bacteria) and  
 CC antiprotzoal agents, specifically effective against bacteria and  
 CC protozoa resistant (especially multi-resistant) to conventional  
 CC antibiotics. Typically polycyclic macrolactones are useful for combating  
 CC tropical protozoal diseases (e.g. malaria, leishmaniasis, sleeping  
 CC sickness and Chagas disease) and infections caused by resistant Gram  
 CC positive bacteria such as methicillin- and vancomycin-resistant  
 CC *Staphylococcus aureus* strains. Polycyclic macrolactones are also useful  
 CC as disinfectants (especially in hospitals and other medical  
 CC establishments) and as lead structures for the development of further  
 CC active agents. This sequence represents the *Verrucosipora* strain AB 18-  
 CC 032 16S rRNA DNA which is used to phylogenically classify the bacterial  
 CC strain.

XX      PT      Propionibacterium acnes polypeptides and nucleic acids useful for
XX      PT      vaccinating against and diagnosing infections, especially useful for
XX      PT      treating acne vulgaris.
XX      PS      Claim 1; SEQ ID NO 35; 1069pp; English.
XX      CC      Sequences AAS59506-AAS59804 represent DNA molecules encoding
XX      CC      Propionibacterium acnes immunogenic polypeptides. The proteins and their
XX      CC      associated DNA sequences are used in the treatment, prevention and
XX      CC      diagnosis of medical conditions caused by P. acnes. The disorders include
XX      CC      SAPHO syndrome (synovitis, acne, pustulosis, hyperostosis and
XX      CC      osteomyelitis), uveitis and endophthalmitis. P. acnes is also involved in
XX      CC      infections of bone, joints and the central nervous system, however it is
XX      CC      particularly involved in the inflammatory lesions associated with acne
XX      CC      vulgaris. A method for detecting the presence or absence of P. acnes in a
XX      CC      patient comprises contacting a sample with a binding agent that binds to
XX      CC      the proteins of the invention and determining the amount of bound protein
XX      CC      in the sample. The polypeptides may be used as antigens in the production
XX      CC      of antibodies specific for P. acnes proteins. These antibodies can be
XX      CC      used to downregulate expression and activity of P. acnes polypeptides and
XX      CC      therefore treat P. acnes infections. The antibodies may also be used as
XX      CC      diagnostic agents for determining P. acnes presence, for example, by
XX      CC      enzyme linked immunosorbent assay (ELISA). This sequence encodes the
XX      CC      polypeptides shown in AAU47822-AAU47846. Note: The sequence data for this
XX      CC      patent did not form part of the printed specification, but was obtained
XX      CC      in electronic format directly from WIPO at
XX      CC      ftp.wipo.int/pub/published_pct_sequences

XX      PT      New Propionibacterium acnes polypeptides and polynucleotides encoding the
XX      PT      polypeptide, useful for diagnosing, preventing or treating acne vulgaris,
XX      PT      or for stimulating an immune response specific for a P. acnes protein.
XX      PS      Claim 1; SEQ ID NO 35; 1481pp; English.
XX      CC      The invention relates to an isolated polynucleotide (ACF64435-ACF64733)
XX      CC      encoding a Propionibacterium acnes protein. The invention also relates to
XX      CC      polypeptides encoded by the polynucleotides (ABM35624-ABM64536) and to
XX      CC      immunogenic fragments of P. acnes polypeptides. The invention
XX      CC      additionally encompasses expression vectors and host cells comprising a
XX      CC      polynucleotide of the invention; antibodies against polypeptides of the
XX      CC      invention; fusion proteins comprising a polypeptide of the invention; a
XX      CC      method for stimulating an immune response specific for a P. acnes
XX      CC      polypeptide and an isolated T cell population comprising T cells prepared
XX      CC      via this method; a vaccine composition (comprising P. acnes polypeptides,
XX      CC      polynucleotides, antibodies, fusion proteins, T cell populations, or
XX      CC      antigen-presenting cells that express the polypeptide); a method and kit
XX      CC      for detecting or determining the presence or absence of P. acnes in a
XX      CC      patient; and a method for inhibiting the development of P. acnes in a
XX      CC      patient. The P. acnes polypeptides, polynucleotides, antibodies, fusion
XX      CC      proteins, T cell populations or antigen-presenting cells that express the
XX      CC      polypeptides are useful for diagnosing, preventing or treating acne
XX      CC      vulgaris, or for stimulating an immune response specific for a P. acnes
XX      CC      protein. The polynucleotides can also be used as probes or primers for
XX      CC      nucleic acid hybridisation. The vaccine composition is useful for the
XX      CC      stimulation of an immune response against P. acnes, or for treating acne,
XX      CC      and the kit is useful for performing a diagnostic assay. The present
XX      CC      sequence represents a P. acnes DNA contig which is specifically claimed
XX      CC      in the invention. Note: The sequence data for this patent did not form
XX      CC      part of the printed specification, but was obtained in electronic format
XX      CC      directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

XX CC The invention describes a new method for diagnosis, identification and
XX CC characterisation of Mycobacterium tuberculosis or any other mycobacteria
XX CC by using polymerase chain reaction (PCR) and shift mobility assay (SMA)
XX CC in urea-polyacrylamide gel (UPAGE) comprises culturing, DNA extraction,
XX CC DNA amplification and shift mobility assay. The method is based on
XX CC divergence in sequences found in 16S rRNA to identify mycobacteria
XX CC species, since a remarkable shift of heteroduplex bands are obtained
XX CC between single stranded and homoduplex bands in UPAGE. The method is
XX CC compared with other detection methods. The sensitivity of other assays
XX CC suffer due to the tendency of the denatured PCR product strands to
XX CC reassociate and exclude oligonucleotide probes, and stearic interference
XX CC between the bound oligonucleotides and the solid support which impede
XX CC hybridization to nucleic acids in solution. Sequences AAX99193-237
XX CC represent 16S rRNA gene regions of some mycobacterial species

XX Example 1; SEQ ID NO 1; 16pp; English.
PS
XX
XX The present invention relates to the isolation of novel microorganism
CC strains of Saccharothrix designated YS-44442 and YS-45494. Also disclosed
CC is a method for isolating 3-hydroxy-3-methylglutaryl (HMG)-CoA reductase
CC inhibitors such as pravastatin. The Saccharothrix strains YS-44442 and YS
CC -45494 are useful for producing pravastatin. The method involves
CC cultivating the strains at a suitable condition to generate a
CC fermentation broth, feeding compactin into the broth, fermenting the
CC broth for a period of time to convert the compactin to pravastatin, and
CC isolating the pravastatin from the broth. The fermentation broth is
CC cultivated for less than 2 days, preferably for 18 hours. The
CC fermentation broth is derived from a seed culture of the microorganism
CC which is cultivated at a suitable condition for 18-48 hours before
CC inoculation into the broth. The broth is fermented for less than 5 days,
CC preferably 3 days, most preferably less than 24 hours. The method of the
CC invention is useful for isolating HMG-CoA reductase inhibitor such as
CC pravastatin, compactin or lovastatin, preferably pravastatin. The
CC pravastatin or HMG-CoA reductase inhibitors are useful for reducing blood
CC cholesterol levels. The present sequence represents Saccharothrix strain
CC YS-44442 16S rDNA sequence.

 XX Novel nucleic acid fragment useful for converting ketone substrates to  
 PT the corresponding lactone or ester, is isolated from Rhodococcus,  
 PT Arthrobacter or Acidovorax, encoding Baeyer-Villiger monooxygenase  
 PT polypeptide.  
 XX  
 XX Claim 54; SEQ ID NO 6; 225pp; English.  
 XX  
 XX The invention relates to a novel isolated nucleic acid fragment  
 CC comprising a fragment encoding a Baeyer-Villiger (BV) monooxygenase  
 CC polypeptide having a sequence of 542, 541, 439, 518, 462, 523, 493, 539,  
 CC 649, 494, 499, 545, 532 or 538 amino acids defined in the specification;  
 CC a nucleic acid molecule that hybridises with the above sequence under the  
 CC hybridisation conditions; or their complements. The BV monooxygenase  
 CC fragment is useful for obtaining a nucleic acid fragment encoding a BV  
 CC monooxygenase polypeptide, by probing a genomic library with the  
 CC fragment, identifying a DNA clone that hybridises with the fragment, and  
 CC sequencing the genomic fragment that comprises the above identified  
 CC clone, where the sequenced genomic fragment encodes a BV monooxygenase  
 CC polypeptide. The genes and their products are useful for converting  
 CC suitable ketone substrates to the corresponding lactone or ester. This  
 CC polynucleotide sequence represents the 16s rDNA gene from Arthrobacter  
 CC sp. BP2 relating to the Baeyer-Villiger enzymes of the invention.

PT Binding inhibitor of muscarinic acetylcholine receptor subtype 4 or 3
PT useful for treating diseases e.g. asthma, contains chelate having TP
PT 0052A-F compound derived from Nocardia species TP-A0674 and metal ion.
XX
PS Disclosure; SEQ ID NO 1; 22pp; Japanese.
XX
CC The invention relates to a novel binding inhibitor of muscarinic
CC acetylcholine receptor subtype 4 or 3, comprising a chelate having a TP
CC 0052A-F compound or its salt and a metal ion. The invention further
CC comprises a method and a microorganism for producing the novel binding
CC inhibitor. The binding inhibitor and compound are useful as central
CC analgesics and memory improving drugs, for treating Parkinson's disease,
CC asthma, chronic obstructive pulmonary disease, overactive bladder,
CC frequent urination and urinary incontinence. This polynucleotide sequence
CC represents the 16S ribosomal DNA of a Nocardia sp. TP-A0674
CC microorganism, useful in producing a muscarinic acetylcholine receptor
CC binding inhibitor compound of the invention.

 PT and traversing graphs.

XX

PS Disclosure; SEQ ID NO 11; 133bp; English.

XX

CC This invention describes a novel method for obtaining sequence  
 CC information from a target biomolecule and involves fragmenting the target  
 CC biomolecule into several fragments by partial cleavage, performing mass  
 CC spectrometry on fragments to produce mass spectra, extracting peak  
 CC information from the produced mass spectra, constructing sequencing graph  
 CC using the extracted peak information and traversing the sequencing graphs  
 CC to reconstruct sequence information of the target biomolecule. The target  
 CC biomolecule is nucleic acid molecule such as DNA or RNA, or is a protein  
 CC and the compositions of the two fragments are the base compositions or  
 CC amino acid compositions. This method preferably involves subjecting the  
 CC nucleic acid molecule to partial cleavage reactions with one or more  
 CC specific cleavage reagents, thus generating two or more fragments that  
 CC are specific cleavage products, determining the molecular weights of the  
 CC two or more fragments, determining the possible base compositions of the  
 CC two or more fragments, ordering the possible base compositions of the two  
 CC or more fragments according to the number of specific cleavage sites that  
 CC are not cleaved in each fragment, constructing one or more sequencing  
 CC graphs that are a graph theoretical representation of the ordered base  
 CC compositions for the two or more fragments, and traversing the one or  
 CC more sequencing graph to reconstruct one or more underlying sequence  
 CC candidates, where each sequencing graph corresponds to the ordered base  
 CC compositions derived from a partial cleavage reaction with one base-  
 CC specific cleavage reagent. This method further involves scoring the one  
 CC or more underlying sequence candidates and determining the rank order of  
 CC fitness, where the scoring is done by statistical analysis or maximum  
 CC likelihood statistical analysis. This method determines epigenetic  
 CC changes in a target nucleic acid molecule relative to reference nucleic  
 CC acid molecule and allows the sequencing of large biomolecules. The  
 CC invention also describes a method of producing a candidate sequence of a  
 CC biomolecule which involves receiving several sequencing graphs having  
 CC several vertices and edges, where each vertex represents a compomer of  
 CC the biomolecule and each edge represents a cut base of the sequencing  
 CC graph and generating the candidate sequence by traversing several  
 CC sequencing graphs. This second method further involves traversing several  
 CC sequencing graphs by tracing through each sequencing graph, starting at a  
 CC source vertex. The results of each method can be read by a program  
 CC product for use in a computer that executes program instructions recorded  
 CC in a computer-readable media to produce a candidate sequence of a  
 CC biomolecule or to obtain sequence information in a target biomolecule.  
 CC The target biomolecule contains a sequence variation, which is a mutation  
 CC or a polymorphism. The target is a target nucleic acid molecule from an  
 CC organism chosen from eukaryotes, prokaryotes and viruses, preferably a  
 CC bacterium. The specific cleavage reagent is an RNase chosen from RNase  
 CC T1, RNase U2, RNase PhY, RNase A, chicken liver RNase (RNase CL3) and  
 CC cusavatin, or a glycosylase. The sequence variations in the target  
 CC biomolecule permit genotyping a subject, forensic analysis, disease  
 CC diagnosis or disease prognosis. The novel methods are useful for de novo  
 CC sequencing, to identify genetic disease or chromosome abnormality,  
 CC identifying a predisposition to a disease, or condition including  
 CC obesity, atherosclerosis, or cancer, to identify an infection by an  
 CC infectious agent, to identify a pathogen, determine haplotypes, analyze  
 CC microsatellite sequences, and short tandem repeat (STR) loci, determine  
 CC allelic variation and/or frequency, and analyze cellular methylation  
 CC patterns. This sequence represents an amplicon used to illustrate the  
 CC sequencing technique described in the invention.

 DR Production of seasoning liquors with the flavor of vegetables pickled in

PT salted rice bran.  
 XX Disclosure; Page 41-43; 45pp; Japanese.  
 XX The invention relates to a method of producing seasoning liquors with the flavour of vegetables pickled in salted rice bran paste by culturing a microorganism in a rice bran dispersion to produce gamma-dodecalactone and/or gamma-dodecelactone. The microorganism produces lactic acid, propionic acid, gamma-dodecalactone and/or gamma-dodecelactone. The microorganism is especially a novel strain of *Corynebacterium* (strain NK-1, FERM BP-6329) with properties defined in the specification. This sequence represents the 16S rRNA gene from the novel *Corynebacterium* strain. The seasoning liquor is used for preparing a salted rice bran pickle bed which provides pickles

 DR Determining a bacterium species comprises providing oligonucleotide primer set comprising SEQ-FOR and SEQ-REV in a complimentary fashion.  
 PT Disclosure; SEQ ID NO 16; 74pp; English.  
 XX The invention relates to a method (M1) for determining a bacterium species. (M1) comprises: (a) culturing a bacterium from a specimen; (b) extracting a genomic nucleotide from the bacterium to provide a nucleotide template; (c) annealing a region of a nucleotide template to a specific oligonucleotide primer set comprising SEQ-FOR and SEQ-REV in a complementary fashion, the primer set designed to provide a product having a predetermined size dictated by a complementary primer set; (d) amplifying the region of the nucleotide template to produce the product; and (e) determining a species of a bacterium in a nucleotide sequence of the product. Also described is an alternative method (M2) for determining a bacterium species comprising: (a) providing a specimen or a sample having a template; (b) providing a pair of primers selected from: (i) a first forward primer having consecutive bases of an AFB-f comprising any

CC of the 36 sequences of 15-22 bp (AEA22417-AEA22452), or their fragments  
 CC or variations and a first reverse primer having consecutive bases of an  
 CC AFB-r comprising any of the 36 sequences of 15-22 bp (AEA22453-AEA22488)  
 CC or their fragments or variations, (ii) a second forward primer having  
 CC consecutive bases of an UB-f comprising any of the 28 sequences of 15-21  
 CC bp (AEA22489-AEA22516) or their fragments or variations and a second  
 CC reverse primer having consecutive bases of an UB-r comprising any of the  
 CC 28 sequences of 15-21 bp (AEA22517-AEA22544) or their fragments or  
 CC variations, or (iii) a first forward primer having consecutive bases of  
 CC an AFB-f of AEA22417-AEA22452 or their fragments or variations and a  
 CC second reverse primer having consecutive bases of an UB-r of AEA22517-  
 CC AEA22544 or their fragments or variations; (c) the specimen; and (d)  
 CC comparing the product from the specimen with a nucleotide sequence from a  
 CC database to determine the bacterium species present in the specimen. The  
 CC methods are useful for determining a bacterium species. The present  
 CC sequence represents a Mycobacterium szulgai 16S rRNA nucleotide sequence,  
 CC which is used in the exemplification of the present invention.

PT Detecting Mycobacterium species, involves in vitro amplification of 16S
PT rRNA or DNA encoding RNA in nucleic acid amplification mixture using
PT specific primers, and detecting the amplified nucleic acid.
XX
PS Claim 1; Page 35; 44pp; English.
XX
CC The invention relates to a method of detecting Mycobacterium species,
CC that involves amplifying Mycobacterium 16S ribosomal RNA (rRNA) or DNA
CC encoding 16S rRNA in an in vitro nucleic acid amplification mixture
CC comprising a polymerase, and at least two primers, and then detecting the
CC amplified nucleic acid. The method is relatively simple and useful for
CC detecting the presence of various Mycobacterium species in a biological
CC sample, and thus important for diagnosis of infections resulting from
CC them. The method is especially important for screening opportunistic
CC infections caused by M. tuberculosis or a Mycobacterium other than
CC tuberculosis (MOTT). The present sequence is a PCR primer used for
CC amplifying Mycobacterium 16S rRNA

XX Detection of mycobacteria by shift mobility assay.

XX Disclosure; Fig 7; 20pp; English.

XX The invention describes a new method for diagnosis, identification and CC characterisation of Mycobacterium tuberculosis or any other mycobacteria CC by using polymerase chain reaction (PCR) and shift mobility assay (SMA) CC in urea-polyacrylamide gel (UPAGE) comprises culturing, DNA extraction, CC DNA amplification and shift mobility assay. The method is based on CC divergence in sequences found in 16S rRNA to identify mycobacteria CC species, since a remarkable shift of heteroduplex bands are obtained CC between single stranded and homoduplex bands in UPAGE. The method is CC fast, simple and can produce information not easily obtained when CC compared with other detection methods. The sensitivity of other assays CC suffer due to the tendency of the denatured PCR product strands to CC reassociate and exclude oligonucleotide probes, and steric interference CC between the bound oligonucleotides and the solid support which impede CC hybridization to nucleic acids in solution. Sequences AAX99193-237 CC represent 16S rRNA gene regions of some mycobacterial species

XX Detection of mycobacteria by shift mobility assay.

XX Disclosure; Fig 7; 20pp; English.

XX The invention describes a new method for diagnosis, identification and CC characterisation of Mycobacterium tuberculosis or any other mycobacteria CC by using polymerase chain reaction (PCR) and shift mobility assay (SMA) CC in urea-polyacrylamide gel (UPAGE) comprises culturing, DNA extraction, CC DNA amplification and shift mobility assay. The method is based on CC divergence in sequences found in 16S rRNA to identify mycobacteria CC species, since a remarkable shift of heteroduplex bands are obtained CC between single stranded and homoduplex bands in UPAGE. The method is CC fast, simple and can produce information not easily obtained when CC compared with other detection methods. The sensitivity of other assays CC suffer due to the tendency of the denatured PCR product strands to CC reassociate and exclude oligonucleotide probes, and steric interference CC between the bound oligonucleotides and the solid support which impede CC hybridization to nucleic acids in solution. Sequences AAX99193-237 CC represent 16S rRNA gene regions of some mycobacterial species

XX
CC The present invention relates to probes (ADF93908-ADF94059) for the
CC specific detection and identification of harmful microorganisms in
CC samples of foods and drug compositions. The probe sequences are derived
CC from the V1, V2 and/or V3 regions of the 16S rRNA of the microorganism,
CC or its complementary sequence. Detection and identification of the
CC microorganism is by amplification of the complete 16S rRNA gene using
CC primers ADF94060 and ADF94061, labelling the amplification product (a
CC fluorescence label is preferred), and hybridising to the probe or probes
CC of the invention. The probes may be immobilised on a DNA chip. The
CC microorganism is selected from Actinobacillus actinomycetemcomitans,
CC Acinetobacter calcoaceticus, Haemophilus influenzae, Stenotrophomonas
CC maltophilia, Proteus mirabilis, Streptococcus pneumoniae, Pseudomonas
CC aeruginosa, Citrobacter freundii, Veillonella parvula, Providencia

XX Novel oligo-nucleotide(s) which hybridise with the 16S rRNA gene of  
PT bacteria - used for detection and identification of acid-fast bacteria,  
PT eg. Mycobacterium.  
XX  
PS Claim 1; Page 10; 13pp; Japanese.  
XX  
CC AAQ94743-46 are oligonucleotides used for the detection and  
CC identification of acid-fast bacteria (pref. Mycobacterium) by hybridising  
CC with the base sequence of the 16S rRNA gene of the bacteria. The  
CC oligonucleotides can be represented by all or a part of the 203 base  
CC sequence shown here. Mycobacteria are gram-positive bacteria which grow  
CC very slowly and require a lot of time for culture for detection (longer  
CC than one month). The probes provide a simple, rapid and exact method for  
CC detection and identification of the bacteria. The method can be applied  
CC directly to sputum or blood samples and the result obtd. within one day.  
CC AAQ94747-60 are specific probes for different Mycobacteria species

XX PT inhibiting bacterial protein expression and treating bacterial infection.

XX PS Claim 26; Page 60-61; 73pp; English.

XX CC This polynucleotide comprises the 16S ribosomal RNA (rRNA) gene of  
XX CC Mycobacterium tuberculosis. The invention relates to methods and  
XX CC compositions for the treatment of Gram-negative bacterial infections  
XX CC employing novel oligonucleotides as antimicrobial agents. The  
XX CC oligonucleotides are targeted to the Shine-Dalgarno (SD) region of  
XX CC prokaryotes to inhibit bacterial expression and hence inhibit bacterial  
XX CC infection. They preferably comprise 10-35 consecutive bases of the 3' end  
XX CC of a bacterial 16S rRNA (see also AAV24291-95). An oligonucleotide may  
XX CC also include a transport moiety and may have DNA phosphate modifications  
XX CC to increase nuclease resistance, or may be formulated in a liposome. A  
XX CC claimed method for treating a bacterial infection of a patient comprises  
XX CC administering a liposomal formulation of such an oligonucleotide. The  
XX CC oligonucleotides can be used particularly for treating bacterial  
XX CC infections in pulmonary diseases such as cystic fibrosis or tuberculosis.  
XX CC Since the SD sequence is not present in eukaryotic cells, the  
XX CC oligonucleotides provide a pathogen-specific therapeutic method

XX Oligonucleotide primers useful for detecting microorganisms of the genus  
 PT Mycobacterium.

PS Example; Fig 3; 2lpp; English.

CC This sequence is the Mycobacterium tuberculosis 16S rRNA gene. This  
 CC sequence is used in an example of a method using oligonucleotide primers  
 CC for amplification of a genus specific sequence of the 16S rRNA gene. The  
 CC method of the invention consists of using primers AAZ35572-235586 to  
 CC amplify M. tuberculosis DNA and then detecting the amplified nucleic  
 CC acids. The oligonucleotides are useful for the detection of species of  
 CC medical interest of the genus Mycobacterium. In particular the detection  
 CC can be used for human and veterinary diagnosis from samples of biological  
 CC fluids or tissue e.g. sputum, bronchial washings, gastric washings,  
 CC blood, milk, lymph, skin and soft tissues. Identifying the mycobacterium  
 CC using the nucleic acid based diagnostic assay reduces the time required  
 CC for an accurate diagnosis as cultivation of the organisms is not required

XX Antibacterial compound, useful for treating bacterial infections and as  
 PT livestock and poultry food supplement, comprises antisense  
 PT oligonucleotides complementary to bacterial 16S and 23S rRNA.

PS Disclosure; Page; 62pp; English.

XX AAS11021-AAS11034 represent the coding sequences of bacterial 16S  
 CC ribosomal RNA (rRNA) genes. The sequences were used to design anti-  
 CC bacterial compounds comprising substantially uncharged antisense  
 CC oligomers containing 8-40 nucleotide subunits, including a targeting  
 CC nucleic acid sequence at least 10 nucleotides in length which is  
 CC complementary to a bacterial 16S or 23S rRNA nucleic acid sequence. The  
 CC antisense oligomers are used for treating a bacterial infection in a  
 CC human or a mammalian animal produced by Escherichia coli, Salmonella  
 CC typhimurium, Pseudomonas aeruginosa, Vibrio cholera, Neisseria  
 CC gonorrhoea, Helicobacter pylori, Bartonella henselae, Haemophilus  
 CC influenza, Shigella dysenteriae, Staphylococcus aureus, Mycobacterium  
 CC tuberculosis, Streptococcus pneumoniae, Treponema pallidum and Chlamydia  
 CC trachomatis. The antibacterial compound may be used as a food grain  
 CC supplement in livestock and poultry food composition. Note: The present  
 CC sequence is not shown in the specification but has been accessed from  
 CC GenBank using the appropriate accession number given in the specification

XX  
XX Claim 4; Page 168-169; 208pp; English.  
XX  
CC This invention relates to a novel method for isolating, depleting or  
CC separating a targeted nucleic acid, such as rRNA, from a sample  
CC comprising targeted and non-targeted nucleic acids. It effects a way of  
CC enriching for non-targeted nucleic acids such as mRNAs. Isolating  
CC sufficient quantities of high quality bacterial mRNA is a demanding  
CC process which impedes analysis of bacterial gene expression in the  
CC presence of host cells. A small percentage of bacterial mRNAs may be poly  
CC -A tailed, but these are targeted for degradation and tend to be  
CC unstable. As a result, the commonly employed method for mRNA purification  
CC with eukaryotic cells, oligo-dT capture, is ineffective. The present  
CC invention provides an alternative, more suitable method for mRNA  
CC purification from prokaryotes. The method of the invention comprises the  
CC incubation of a sample with a bridging oligonucleotide (containing a  
CC targeting region) and subsequently incubating with a capture  
CC oligonucleotide allowing the isolation of the target from the sample. The  
CC method is useful for depleting or isolating targeted nucleic acid, for  
CC example rRNA such as prokaryotic 16S or prokaryotic 23S, eukaryotic 17S  
CC or 18S or eukaryotic 28S rRNA, from a sample. The rRNA sequence may  
CC comprise any one of 64 fully defined sequences as given in the  
CC specification. The present sequence is that of a DNA sequence which  
CC represents the sequence of 16S rRNA of Mycobacterium tuberculosis related  
CC to the invention.

PT Depleting or isolating targeted nucleic acids e.g. rRNA, involves using a  
PT bridging oligonucleotide comprising bridging region and a targeting  
PT region complementary to a targeted nucleic acid, and a capture  
XX oligonucleotide.

PS Claim 4; Page 169; 208pp; English.

XX This invention relates to a novel method for isolating, depleting or  
XX separating a targeted nucleic acid, such as rRNA, from a sample  
XX comprising targeted and non-targeted nucleic acids. It effects a way of  
XX enriching for non-targeted nucleic acids such as mRNAs. Isolating  
XX sufficient quantities of high quality bacterial mRNA is a demanding  
XX process which impedes analysis of bacterial gene expression in the  
XX presence of host cells. A small percentage of bacterial mRNAs may be poly  
XX -A tailed, but these are targeted for degradation and tend to be  
XX unstable. As a result, the commonly employed method for mRNA purification  
XX with eukaryotic cells, oligo-dT capture, is ineffective. The present  
XX invention provides an alternative, more suitable method for mRNA  
XX purification from prokaryotes. The method of the invention comprises the  
XX incubation of a sample with a bridging oligonucleotide (containing a  
XX targeting region) and subsequently incubating with a capture  
XX oligonucleotide allowing the isolation of the target from the sample. The  
XX method is useful for depleting or isolating targeted nucleic acid, for  
XX example rRNA such as prokaryotic 16S or prokaryotic 23S, eukaryotic 17S  
XX or 18S or eukaryotic 28S rRNA, from a sample. The rRNA sequence may  
XX comprise any one of 64 fully defined sequences as given in the  
XX specification. The present sequence is that of a DNA sequence which  
XX represents the sequence of 16S rRNA of Escherichia coli related to the  
XX invention.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

/note="Site\_1: SalI; Site\_2: BamHI; cDNA library was prepared and sequenced in Mouse Genome Encyclopedia Project of Genome Exploration Research Group in Riken Genomic Sciences Center and Genome Science Laboratory in RIKEN. Division of Experimental Animal Research in Riken contributed to prepare mouse tissues. 1st strand cDNA was primed with a primer [5'-GAGAGAGAAGATCCAAAGAGCTCTTTTTTTTTTTTNN 3'], cDNA was prepared by using trehalose thermo-activated reverse transcriptase and subsequently enriched for full-length by cap-trapper. cDNA went through one round of normalization to Rot = 20.0 and subtraction to Rot = 459.0. Second strand cDNA was prepared with the primer adapter of sequence [5'-GAGAGAGATCTCGATTAAATTAATCCCCCCCCCCC 3']. cDNA was cleaved with XhoI and BamHI. Vector: a modified pBluescript KS(+) after bulk excision from Lambda FLC I."

 RNA prepared and library constructed by W. Walter Lorenz (School of  
 Forest Resources, University of Georgia); plant material prepared  
 by Craig Zimmermann (School of Forest Resources, University of  
 Georgia) using rooted cuttings provided by the Forest Biology  
 Research Cooperative (FBRC) and the COLONES project at the  
 University of Florida; sequencing done in the Laboratory for  
 Genomics and Bioinformatics, University of Georgia. Sequence ends  
 have been trimmed to exclude vector and regions below phred quality  
 16. Three-prime sequences are presented as their reverse complement  
 and have been trimmed to exclude polyA.

/note="Vector: pBluscript SK-; Site 1: EcoRI; Site 2:

XhoI; Toxoplasma RH strain tachyzoites were grown in human

foreskin fibroblast cultures in vitro. The library was

originally constructed by K.L.Wan, Cambridge University.

cDNAs were synthesized from polyA RNAs by oligo d(T)

priming and directionally cloned into the EcoRI to XhoI

sites of the Lambda ZapII vector using the ZAP-cDNA

synthesis kit (Stratagene). The primary cDNA library was

mass excised as phagemid using EXassist helper phage

(Stratagene). Phagemid DNA was extracted by

phenol-chloroform method, and hybridized against a pool of

over-represented ESTs (N&gt;=12, from 5596 previous reads).

The subtracted library was electroporated into DH10B

(GeneHog, Invitrogen, Inc). WARNING: the library contains

a small percentage of cDNAs derived from the human host

cells. Library Source: David Sibley, Washington

University."

This library was generated by cloning cDNAs directionally into Uni-ZAP(Stratagene) (T3 primer/EcoRI are at the 5'-end and T7/XhoI are at the 3'-end). The library was excised (now in pBluescript SK(+)) and normalized (Bonaldo et al 1996 Genome Research 6:791-806). Library constructed by Thomas Baum (tbaum@iastate.edu), Iowa State University, Plant Pathology Department and Jeff McDermott (jmcderm@iastate.edu).

Seq primer: T3 from Gibco.

This GSS is part of a random genomic sequencing program of thirteen

yeast species: Saccharomyces bayanus var. uvarum, Saccharomyces

exiguus, Saccharomyces servazzii, Zygosaccharomyces rouxii,

Saccharomyces kluyveri, Kluyveromyces thermotolerans, Kluyveromyces

lactis var. lactis, Kluyveromyces marxianus var. marxianus, Pichia

angusta, Debaryomyces hansenii var. hansenii, Pichia sorbitophila,

Candida tropicalis and Yarrowia lipolytica. Genomic inserts of 3 to

5 kb were prepared and both extremities were sequenced. See

keywords for description of this sequence and for the sequence of

the other extremity of this insert.

/note="Vector: Express 1: Total and poly A+ RNA was

isolated from the indicated stickleback tissue, and a cDNA

library was constructed in the Express 1 plasmid vector by

Open Biosystems. First strand cDNA synthesis was primed

with an 54 bp linker primer containing an oligodT sequence

preceded by a synthetic NotI site (first strand primer:

5'-GACTAGTCTAGATCGGCGGCC(T)25-3'). Following

second strand synthesis, cDNAs were made blunt at the end

corresponding to the original 5 prime end of mRNA, and

cloned directionally into the NotI and EcoRV sites of

Express 1. Note that the EcoRV site is typically destroyed

in the blunt end cloning, leaving a junction of the form

'xxxATC' (where is ATC is the second half of the EcoRV

site, and xxx is derived from the cDNA sequence). A map of

the Express 1 vector is available at:

http://www.openbiosystems.com/cdna\_library\_construction\_fa

q.php#8 The primary library was transformed and amplified in DH10B (T1 phage resistant) bacteria."

COMMENT             Submitted (06-SEP-2000) Genoscope - Centre National de Sequencage,
                    2 rue Gaston Cremieux, CP 5706, 91057 EVRY cedex, FRANCE. (E-mail :
                    seqref@genoscope.cns.fr - Web : www.genoscope.cns.fr)
                    This GSS is part of a random genomic sequencing program of thirteen
                    yeast species: Saccharomyces bayanus var. uvarum, Saccharomyces
                    exiguus, Saccharomyces servazii, Zygosaccharomyces rouxii,
                    Saccharomyces kluyveri, Kluyveromyces thermotolerans, Kluyveromyces
                    lactis var. lactis, Kluyveromyces marxianus var. marxianus, Pichia
                    angusta, Debaryomyces hansenii var. hansenii, Pichia sorbitophila,
                    Candida tropicalis and Yarrowia lipolytica. Genomic inserts of 3 to
                    5 kb were prepared and both extremities were sequenced. See
                    keywords for description of this sequence and for the sequence of
                    the other extremity of this insert.

## JOURNAL

## COMMENT

Washington University School of Medicine  
 1st strand of cDNA was synthesized with reverse transcriptase and  
 oligo(dT) beads, then cDNA was amplified by PCR using modified  
 SMART primers. The final cDNA was cloned in pAMP1 vector in  
 annealing reaction with Uracil DNA Glycosylase (UDG). Library  
 constructed by Y.Korshunova and M. Lovett. Library materials  
 provided by Mills JC & Gordon JI.

Putative full length read

vector to vector length is

Possible reversed clone: similarity on wrong strand

Seq primer: -4ORP from Gibco.

This library consists of a mixture of individually tagged
normalized libraries constructed from rat placenta, adult
lung, brain, liver, kidney, heart, spleen, ovary, and
muscle. The tag is a string of 3-5 nucleotides present
between the Not I site and the oligo-dt track which allows
identification of the library of origin of a clone within
the mixture."

 Site 2: NotI; Mouse cDNA project by the Laboratory of  
 Genetics, National Institute on Aging (NIA), Intramural  
 Research Program, NIH (http://lgsun.grc.nia.nih.gov/cDNA).  
 This is a long-transcript enriched cDNA library (Ref.  
 Genome Res. 11: 1553-1558 (2001). [PMID: 11544199]). Total  
 RNAs were extracted from a pool of 8 embryos at 10.5-days  
 postcoitum. Double-stranded cDNAs were synthesized with an  
 oligo(dT) primer [Invitrogen]:  
 5'-pGACTGATCTAGTCGAGCGCGCCCTTTT-3' from  
 2ug of total RNA, treated with T4 DNA polymerase, and  
 purified by ethanol-precipitation. The cDNAs were ligated  
 to Lona-linker Li-Sal4, purified by phenol/chloroform, and  
 separated from free linkers by Centricon 100. Then, the  
 cDNAs were amplified by long-range high fidelity PCR using  
 Ex Taq polymerase (Takara) with a primer Sal4-S. The

products were purified by phenol/chloroform and Centricon  
 100. The cDNAs were digested with SalI and NotI enzymes  
 and cloned into SalI/NotI site of pCMV-SPORT6 plasmid  
 vector. The DH10B E. coli host was transformed with the  
 ligation mixture by the standard chemical method. The  
 average insert size is about 3.4Kb. The library was  
 constructed by Yulan Piao."

from a mixture of normalized libraries from ten regions of  
the mouse brain (cerebellum, brain stems, olfactory bulbs,  
hypothalamus, cortex, amygdala, basal ganglia, pineal  
gland, striatum, hippocampus). The driver used for  
subtraction consisted of a pool of 20,000 cDNA clones  
obtained from non-normalized and normalized libraries of  
these ten regions of the mouse brain."

/organism="Mus musculus"

/mol\_type="mRNA"

/strain="BALB/c"  
/db\_xref="taxon:10090"  
/clone="gi135c11"  
/sex="male and female"  
/dev\_stage="Post natal day 5 to 13"  
/clone\_lib="Mouse Organ of Corti cDNA pbluescript"  
/notes="Organ: Organ of Corti; Vector: pbluescript; The  
organ of Corti (OC) was fine dissected from a total of 386  
OC as follows: 102 samples from post-natal (P) day 5; 72  
from P6; 60 from P7; 46 from P8; 18 from P9; 20 from P10;  
14 from P12 and 24 from P13. After killing animals by  
cervical dislocation followed by decapitation, the bulla  
was removed and opened in Leibowitz medium. The bony  
capsule of the cochlea was chipped away, stria vascularis  
and spiral ligament were removed and the sensory  
epithelium was carefully dissected out of the modiolus.  
Total RNA was extracted using the Micro Fasttrack kit  
(catalog # KI593-02; Invitrogen, Carlsbad, CA), according  
to manufacturer's instructions. Reverse transcription and  
library construction were carried out with the Uni-Zap XR  
vector kit (catalog # 237211, Stratagene) and Uni-Zap XR  
Gigapack III Gold Cloning kit (catalog # 237612), both  
from Stratagene (La Jolla, CA, USA), according to  
manufacturer's instructions. Briefly: 1.5 ug mRNA was  
reverse transcribed using a hybrid oligo(dT) linker-primer  
that contains an Xho I site. First strand synthesis was  
primed with the linker-primer and transcribed using  
Mooney murine leukemia virus reverse transcriptase  
(MMLV-RT) and 5-methyl dCTP. The second strand was  
synthesized with DNA polymerase and RNase H. Complementary  
DNA was blunt ended with Pfu DNA polymerase, ligated with  
EcoR I adapters in the presence of ligase and digested  
with Xho I. The cDNA was sequentially size fractionated  
over Pharmacia Size Sep400 (Pharmacia, Uppsala, Sweden)  
and Clontech Chroma Spin-1000 (Clontech, Palo Alto, CA)  
columns to enrich for cDNAs greater than 400bp and 1000  
bp, respectively. The cDNA was then directionally ligated  
to the Uni-Zap XR vector, which had been predigested with  
EcoR I and Xho I. The phagemid was packaged with Gigapack  
III Gold and, upon titration on Xli Blue MRF' cells, the  
yield of the phage library was estimated to be 11,100,000  
recombinants. Stratagene's ExAssist Interference  
resistance helper phage (catalogue # 211203) was adopted  
to rescue plasmid DNA from the phages. Upon plating of the  
rescued library, individual cDNA clones were selected and  
grown in 96-well, 2 ml growth plate. Plasmid DNA was  
purified from 200 ul of saturated culture with the  
Concert96(TM) plasmid purification kit (Invitrogen,  
Carlsbad, CA) as instructed by the manufacturer. ESTs from  
the 5' end of the cDNA clones were generated with the  
universal M13 reverse primer (CAGGAAACAGCTATGACC) and 25x  
strength BigDye terminator sequencing chemistry (Applied  
Biosystems, Foster City, CA). Sequencing reactions were  
performed on MJ Tetrad thermal cyclers (MJ Research,  
Waltham, MA), and analyzed on 3700 automated capillary  
sequencers using POP5 polymer (Applied Biosystems, Foster  
City, CA). The frequency distribution of the library is  
as follows: 72% of genes have 1 copy; 14.3% 2; 12% 3-10;  
1.4% 11-50 and 0.1% 51-150. As to gene function, 45% of  
genes are present in GenBank and have know function; 23%  
have hits in GenBank, but do not have assigned function;  
12% are uncharacterized ESTs and 20% are unidentified."

This is a long-transcript enriched cDNA library (Ref. Genome Res. 11: 1553-1558 (2001). [PMID: 11544199]). Total RNAs were extracted from a pool of 8 embryos at 10.5-days postcoitum. Double-stranded cDNAs were synthesized with an oligo(dT) primer [Invitrogen: 5'-PGACTAGTCTTAGTCGAGCGGCCCTTTTCTTTT-3'] from 2ug of total RNA, treated with T4 DNA polymerase, and purified by ethanol-precipitation. The cDNAs were ligated to Loner-linker LL-Sal4, purified by phenol/chloroform, and separated from free linkers by Centricon 100. Then, the cDNAs were amplified by long-range high fidelity PCR using Ex Taq polymerase (Takara) with a primer Sal4-S. The products were purified by phenol/chloroform and Centricon 100. The cDNAs were digested with SalI and NotI enzymes and cloned into SalI/NotI site of pCMV-SPORT6 plasmid vector. The DH10B E. coli host was transformed with the ligation mixture by the standard chemical method. The average insert size is about 3.4Kb. The library was constructed by Yulan Piao."

/note="Organ: Shoot apex; Vector: Uni-Zap XR; Site 1:

EcoRI; Site 2: XhoI; This library was constructed by

Xiaolan Zhang. Vegetative Shoot Apical Meristem (SAM) and

leaf primordia staged P1-P4 from 14-17 day-after

germination seedlings were quickly dissected into dry ice

under a light microscope. Total RNA was isolated using

Trizol and mRNA was purified with Dynal Oligo-DT25.

ds-cDNA molecules were generated as follows. First-strand

cDNA was prepared from oligo-dT selected mRNA by priming

with an XhoI oligo-dT primer

(5'-GAGAGAGAGAGAGAGACTAGTCTCGAGTGTGTTTTTTTTTTTTTTT).

The resulting DNA:RNA hybrid was treated with RNase H and used as a template for DNA PolI-catalyzed second strand synthesis. After the addition of EcoRI adaptors, the ds-cDNAs were digested with XhoI and size-selected to be >600 bp. The resulting molecules were directionally cloned into the EcoRI and XhoI sites of the Uni-Zap XR vector.

The lambda library was packaged with Gigapack III Gold packaging extract and was mass excised by XLI-Blue cells and ExAssist helper phage. Excised phagemids were titered in SOLR cells and plated onto LB-ampicillin agar plates.

Base calling was conducted using Phred. Trimming was performed using Lucy with the following criteria:

(-minimum 200 -error 0.01 0.01 -bracket 10 0.01). A low complexity filter was applied and additional trimming was conducted to remove E. coli, vector, and organelle

contamination. After processing ~30% of the sequences contained a minimum of 10 Ts at the beginning of the sequence. For reasons that are not understood many of the clones in this library lack an XhoI site at their 3' ends."

Site 2: NotI; Mouse cDNA project by the Laboratory of Genetics, National Institute on Aging (NIA), Intramural Research Program, NIH (<http://lqson.grc.nia.nih.gov/cDNA>). This is a long-transcript enriched cDNA library (Ref. Genome Res. 11: 1553-1558 (2001)). [PMID: 11544199]. EG cells were obtained from Dr. Brigid L.M. Hogan and RNA was prepared by Dr. Mark C. Carter (NIH/NIA-IRP). EG cells were cultured at 37° C, 5% CO<sub>2</sub> in DMEM supplemented with 15% ES cell-qualified FBS, 0.1mM non-essential amino acids, 2 mM glutamine, penicillin/streptomycin, 1 mM sodium pyruvate, 0.1 mM beta-mercaptoethanol, and 10<sup>-7</sup> units of LIF per liter. Double-stranded cDNAs were synthesized with an Oligo(dT) primer [Invitrogen: 5'-TGACTAGTCTAGATCGAGCGCGCCCTTTTTTTTTT-3'] from 2.5 µg of total RNA, treated with T<sub>4</sub> DNA polymerase, and purified by ethanol-precipitation. The cDNAs were ligated to Long-linker L-Sal4, purified by phenol/chloroform, and separated from free linkers by Centricon 100. Then, the cDNAs were amplified by long-range high fidelity PCR using Ex Taq polymerase (Takara) with a primer Sal4-S. The products were double digested with NotI and SalI enzymes, then purified by phenol/chloroform and Centricon 100. The cDNA mixture was subjected to a special subtraction procedure by Dr. Kazuhiro Kondo at AISIS Cosmos. Then the subtracted cDNAs were cloned into SalI/NotI site of pCMV-SPORTs plasmid vector. The DH10B E. coli host was transformed with the ligation mixture by the standard chemical method. The average insert size is about 2.2kb. The library was constructed by Yulan Piao and Kazuhiro Kondo.

/note="Organ: brain; Vector: pYX-Asc; Site 1: EcoR I;  
Site 2: Not I; The library was constructed according to  
Bonaldo, Lennon and Soares, Genome Research, 6:791-806,  
1996. Denatured mRNA was size fractionated on a 1% agarose  
gel. First strand cDNA synthesis was primed with an  
oligo-dT primer containing a Not I site. Double stranded  
cDNA was size selected according to mRNA size fraction,  
ligated with EcoR I adaptor, digested with Not I, and then  
cloned directionally into pYX-Asc vector. The library tag  
sequence located between the Not I site and the polyA  
tail, is GTGCGTGGAA. This library was created for the  
University of Iowa Mouse Brain Molecular Anatomy Project  
(BMAP): 'Gene Discovery in the Developing Mouse Nervous  
System', supported by National Institutes of Mental Health  
(NIMH), Hemin Chin, Ph.D., program coordinator."

Computational Analysis of Full-Length Mouse cDNAs Compared with Human Genome Sequences Mamm. Genome. 12, 673-677 (2001)  
 Normalization and subtraction of cap-trapper-selected cDNAs to prepare full-length cDNA libraries for rapid discovery of new genes. Genome Res. 10 (10), 1617-1630 (2000)  
 RIKEN integrated sequence analysis (RISA) system--384-format sequencing pipeline with 384 multicapillary sequencer. Genome Res. 10 (11), 1757-1771 (2000)

Computer-based methods for the mouse full-length cDNA encyclopedia: real-time sequence clustering for construction of a nonredundant cDNA library. Genome Res. 11 (2), 281-289 (2001)  
 cDNA library was prepared and sequenced in Mouse Genome Encyclopedia project of Genome Exploration Research Group in Riken Genomic Sciences Center and Genome Science Laboratory in RIKEN Division of Experimental Animal Research in Riken contributed to prepare mouse tissues.

Please visit our web site (<http://genome.gsc.riken.go.jp>) for further details.

/tissue_type="mixed (silks, husks, ears, pollen, shoot
tips, leaf, root tips, whole seed, embryo)"
/dev_stage="varies by tissue"
/lab_host="DH10B T1 phage resistant"
/clone_lib="ZM_BFB"
/notes=vector: pCMV-SPORT 6.1; Site_1: EcoRV; Site_2:
NotI; Maize Full length cDNA library (3530 library)
created by Invitrogen from multiple tissues; Organ: silks,
husks, ears, pollen, shoot tips, leaf, root tips, whole
seed, embryo. This is a Gateway compatible vector,
permitting clone movement to new vector backbones for
expression in diverse host cells using recombination
rather than restriction enzymes. poly(A) + mRNA was
prepared by Invitrogen, and equimolar amounts of RNA from
each of the 12 tissue samples were mixed together for
a normalization step was conducted against the mixture of
RNA sources. Tissues prepared: 1. just emerging silks; 2.
inner husks from ears of sample #1; 3. 20 dap aleurone; 4.
immature tassels, stages from 1-2 mm to 1-2 cm; 5. 2 mm to
2 cm ears; 6. pollen; 7. 1 cm vegetative shoot tips from
15 day old seedlings; all leaves with an expanded or
partially expanded sheath were removed; 8. mature leaf
tissue; 9. 0.5 cm long root tips from 15 day old
seedlings; 10. 10 dap whole seed; 11. 12 dap endosperm and
embryo; 12. 17 dap endosperm and embryo. All of the
sequenced clones in Maize Full-length cDNA Project will be
archived at the University of Arizona. Clones, high
density filters and amplified library can be ordered from
the University of Arizona
(http://www.genome.arizona.edu/orders/).

; GENERAL INFORMATION:

APPLICANT: Walker, Richard L.  
APPLICANT: Read, Deryck H.  
APPLICANT: Hird, David W.  
APPLICANT: Lefebvre, Rance B.  
APPLICANT: Berry, Steven L.  
APPLICANT: Cullor, James S.  
APPLICANT: Lefler, Hank M.  
TITLE OF INVENTION: Vaccine Against Pappillomatous Digital  
TITLE OF INVENTION: Dermatitis (PDD)  
NUMBER OF SEQUENCES: 14  
CORRESPONDENCE ADDRESS:  
ADDRESS: Townsend and Townsend and Crew LLP  
STREET: Two Embarcadero Center, Eighth Floor  
CITY: San Francisco  
STATE: California  
COUNTRY: USA  
ZIP: 94111-3834  
COMPUTER READABLE FORM:  
MEDIUM TYPE: Floppy disk  
COMPUTER: IBM PC compatible  
OPERATING SYSTEM: PC-DOS/MS-DOS  
SOFTWARE: PatentIn Release #1.0, Version #1.30  
CURRENT APPLICATION DATA:  
APPLICATION NUMBER: US/08/943,571  
FILING DATE: 03-OCT-1997  
CLASSIFICATION: 424  
ATTORNEY/AGENT INFORMATION:  
NAME: Parent, Annette S.  
REGISTRATION NUMBER: 42,058  
REFERENCE/DOCKET NUMBER: 023070-081100US  
TELECOMMUNICATION INFORMATION:  
TELEPHONE: (415) 576-0200  
TELEFAX: (415) 576-0300  
INFORMATION FOR SEQ ID NO: 1:  
SEQUENCE CHARACTERISTICS:  
LENGTH: 1503 base pairs  
TYPE: nucleic acid  
STRANDEDNESS: single  
TOPOLOGY: linear  
MOLECULE TYPE: DNA (genomic)  
FEATURE:  
NAME/KEY: rRNA  
LOCATION: 1..1503  
OTHER INFORMATION: /product= "16S rRNA"  
OTHER INFORMATION: /note= "bovine Treponema spirochete strain 2-1498"

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

XX	Detecting Mycobacterium species, involves in vitro amplification of 16S		
PT	rRNA or DNA encoding RNA in nucleic acid amplification mixture using		
PT	specific primers, and detecting the amplified nucleic acid.		
XX	Claim 1; Page 36; 44pp; English.		
XX	The invention relates to a method of detecting Mycobacterium species,		
CC	that involves amplifying Mycobacterium 16S ribosomal RNA (rRNA) or DNA		
CC	encoding 16S rRNA in an in vitro nucleic acid amplification mixture		
CC	comprising a polymerase, and at least two primers, and then detecting the		
CC	amplified nucleic acid. The method is relatively simple and useful for		
CC	detecting the presence of various Mycobacterium species in a biological		
CC	sample, and thus important for diagnosis of infections resulting from		
CC	them. The method is especially important for screening opportunistic		
CC	infections caused by M. tuberculosis or a Mycobacterium other than		
CC	tuberculosis (MOTT). The present sequence is a PCR primer used for		
CC	amplifying Mycobacterium 16S rRNA

 XX  
 CC The invention relates to a novel method for decomposing formaldehyde by  
 CC using microbial cells that belong to Mycobacterium sp. or Fusarium  
 CC oxysporum, and/or the growth medium of the microbial cells. The invention  
 CC further comprises: microbial cells which belong to Mycobacterium sp.  
 CC having the ability to decompose formaldehyde; a formaldehyde  
 CC decomposition agent comprising Mycobacterium sp. and/or the growth medium  
 CC of the microbial cells; and a formaldehyde decomposition agent comprising  
 CC F. oxysporum and/or its growth medium. The method is useful for  
 CC decomposing formaldehyde in sea water by Mycobacterium sp. or F.  
 CC oxysporum that is deposited under FERM P-818690 or FERM P-18403,  
 CC respectively. This polynucleotide sequence represents the Mycobacterium  
 CC sp. DNA of the invention.

 XX  
 CC The invention relates to a method (M1) for determining a bacterium  
 CC species. (M1) comprises: (a) culturing a bacterium from a specimen; (b)  
 CC extracting a genomic nucleotide from the bacterium to provide a  
 CC nucleotide template; (c) annealing a region of a nucleotide template to a  
 CC specific oligonucleotide primer set comprising SEQ-FOR and SEQ-REV in a  
 CC complimentary fashion, the primer set designed to provide a product

CC having a predetermined size dictated by a complementary primer set; (d)  
 CC amplifying the region of the nucleotide template to produce the product;  
 CC and (e) determining a species of a bacterium in a nucleotide sequence of  
 CC the product. Also described is an alternative method (M2) for determining  
 CC a bacterium species comprising: (a) providing a specimen or a sample  
 CC having a template; (b) providing a pair of primers selected from: (i) a  
 CC first forward primer having consecutive bases of an AFB-f comprising any  
 CC of the 36 sequences of 15-22 bp (AEA22417-AEA22452), or their fragments  
 CC or variations; and a first reverse primer having consecutive bases of an  
 CC AFB-r comprising any of the 36 sequences of 15-22 bp (AEA22453-AEA22488)  
 CC or their fragments or variations, (ii) a second forward primer having  
 CC consecutive bases of an UB-f comprising any of the 28 sequences of 15-21  
 CC bp (AEA22489-AEA22516) or their fragments or variations and a second  
 CC reverse primer having consecutive bases of an UB-r comprising any of the  
 CC 28 sequences of 15-21 bp (AEA22517-AEA22544) or their fragments or  
 CC variations, or (iii) a first forward primer having consecutive bases of  
 CC an AFB-f of AEA22417-AEA22452 or their fragments or variations and a  
 CC second reverse primer having consecutive bases of an UB-r of AEA22517-  
 CC AEA22544 or their fragments or variations; (c) the specimen; and (d)  
 CC comparing the product from the specimen with a nucleotide sequence from a  
 CC database to determine the bacterium species present in the specimen. The  
 CC methods are useful for determining a bacterium species. The present  
 CC sequence represents a Mycobacterium fortuitum 16S rRNA nucleotide  
 CC sequence, which is used in the exemplification of the present invention.

 DR 20-100 base probes derived from V1, V2 or V3 regions of 16S rRNA of a  
 PT microorganism for specific detection and identification of the  
 PT microorganism in foods and drug compositions.  
 XX Claim 2; SEQ ID NO 150; 150pp; Japanese.  
 XX The present invention relates to probes (ADF93908-ADF94059) for the  
 CC specific detection and identification of harmful microorganisms in  
 CC samples of foods and drug compositions. The probe sequences are derived  
 CC from the V1, V2 and/or V3 regions of the 16S rRNA of the microorganism,  
 CC or its complementary sequence. Detection and identification of the  
 CC microorganism is by amplification of the complete 16S rRNA gene using  
 CC primers ADF94060 and ADF94061, labelling the amplification product (a  
 CC fluorescence label is preferred), and hybridising to the probe or probes  
 CC of the invention. The probes may be immobilised on a DNA chip. The  
 CC microorganism is selected from Actinobacillus actinomycetemcomitans,  
 CC Acinetobacter calcoaceticus, Haemophilus influenzae, Stenotrophomonas  
 CC maltophilia, Proteus mirabilis, Streptococcus pneumoniae, Pseudomonas  
 CC aeruginosa, Citrobacter freundii, Veillonella parvula, Providencia

XX CC
XX CC The present invention describes a DNA sequence which contains a base
XX CC sequence from bases 544-1758 in the sequence of (I) with 1992 base pairs,
XX CC or a DNA hybridizable with the DNA under stringent conditions and
XX CC encoding a polypeptide with hydroxylase activity on compactin at 6beta-
XX CC position. Also described: (1) DNA containing base sequences from bases
XX CC 544-1758 and from bases 1782-1970 in the sequence of (I) or a DNA
XX CC hybridizable with the DNA under stringent conditions and encoding a
XX CC polypeptide with hydroxylase activity on compactin at the 6beta-position;
XX CC (2) a polypeptide encoded by any of the DNA or containing an amino acid
XX CC sequence based on the polypeptide but with some amino acids deleted,
XX CC substituted or added and having hydroxylase activity on compactin at the
XX CC 6beta-position; (3) a recombinant DNA obtained by integrating with any of
XX CC the DNA; (4) a microorganism transferred with the recombinant DNA; (5) a
XX CC process for producing pravastatin by culturing the transformant
XX CC microorganism before isolating the culture liquor or cells, and addition
XX CC of compactin for reaction to give pravastatin for recovery; and (6)
XX CC Streptomyces sp. TM-6 (FERM BP-8002) or TM-7 (FERM BP-8003). (I) has
XX CC antilipemic activity. The polypeptide and its encoded DNA are applicable
XX CC in constructing transformant microorganisms to synthesize pravastatin for
XX CC treating hyperlipidemia. With the recombinant microorganisms,
XX CC pravastatin can be produced efficiently, with much less galpha
XX CC hydroxylated epimer formed. The present sequence represents a
XX CC Microtetraspora recticatenata IPO14525 nucleotide sequence, which is given
XX CC in the exemplification of the present invention

PS Claim 2; SEQ ID NO 1; 13pp; Japanese.

XX The invention relates to a novel cyclic hydrocarbon degrading agent from  
CC the Rhodococcus genus. The cyclic hydrocarbon degrading agent having  
CC biochemical properties such as: gram positive bacillus, catalase test  
CC positive, nitrate-reduction ability positive, pyrazinamidase negative,  
CC pyrrolidonyl allyl amidase negative, alkali phosphatase positive, beta-  
CC glucuronidase negative, beta-galactosidase negative, alpha-glucosidase  
CC positive, N-acetyl-beta-glucosaminidase negative, urease positive. The  
CC novel Rhodococcus microorganism is Rhodococcus sp. GR-002 strain having  
CC the accession number FERM P-18804. The cyclic hydrocarbon degrading agent  
CC is useful for processing a cyclic hydrocarbon-containing substance, such  
CC as a waste engine oil. The novel Rhodococcus microorganism is useful for  
CC degrading cyclic hydrocarbons containing aromatic hydrocarbons,  
CC cycloaliphatic hydrocarbons, and/or polycyclic aromatic hydrocarbons.  
CC This polynucleotide represents the novel Rhodococcus microorganism 16S  
CC rDNA sequence of the invention.

PT Improving plant productivity comprises introducing into the plant or  
PT propagation material an endophytic actinomycete that facilitates  
PT induction of at least one characteristic related to improved  
PT productivity.  
XX  
PS Claim 1; SEQ ID NO 16; 235pp; English.

XX This invention relates to a novel method for improving plant  
CC productivity. Specifically, it refers to introducing into the plant or  
CC propagation material an endophytic actinomycetes or variant thereof,  
CC where the actinomycetes facilitate induction of a characteristic related  
CC to improved productivity. The present invention further describes  
CC metabolites of the actinomycetes microorganism such as auxin, gibberellin  
CC or cytokinin that are able to induce disease resistance in plants i.e.  
CC provide disease bio-control capabilities against pathogen infection.  
CC Accordingly, the method facilitates the improvement of cereal crop  
CC productivity including increasing germination by up-regulating plant  
CC growth promoting activities, as well as improving plant vigor or flower  
CC and fruit yield. Furthermore, the new actinomycete or metabolite is  
CC useful in the manufacture of a medicament for the therapeutic and/or  
CC prophylactic treatment of a mammalian or non-mammalian subject i.e.  
CC plant. As such, this method provides plant protectants and plant growth  
CC stimulants that exhibit antibacterial, antimicrobial, fungicide,  
CC insecticide and nematocide activities. This polynucleotide is the DNA  
CC sequence of an actinomycetes 16S ribosomal RNA sequence of the invention.

XX Improving plant productivity comprises introducing into the plant or  
PT propagation material an endophytic actinomycete that facilitates  
PT induction of at least one characteristic related to improved  
PT productivity.  
XX Example 18; Fig 19; 235pp; English.  
XX This invention relates to a novel method for improving plant  
CC productivity. Specifically, it refers to introducing into the plant or  
CC propagation material an endophytic actinomycetes or variant thereof,  
CC where the actinomycetes facilitate induction of a characteristic related  
CC to improved productivity. The present invention further describes  
CC metabolites of the actinomycetes microorganism such as auxin, gibberellin  
CC or cytokinin that are able to induce disease resistance in plants i.e.  
CC provide disease bio-control capabilities against pathogen infection.  
CC Accordingly, the method facilitates the improvement of cereal crop  
CC productivity including increasing germination by up-regulating plant  
CC growth promoting activities, as well as improving plant vigor or flower  
CC and fruit yield. Furthermore, the new actinomycete or metabolite is  
CC useful in the manufacture of a medicament for the therapeutic and/or  
CC prophylactic treatment of a mammalian or non-mammalian subject i.e.  
CC plant. As such, this method provides plant protectants and plant growth  
CC stimulants that exhibit antibacterial, antimicrobial, fungicide,  
CC insecticide and nematocide activities. This polynucleotide is the DNA  
CC sequence of an actinomycetes 16S ribosomal RNA sequence of the invention.

New abyssomicin polycyclic macrolactone compounds, useful as antibiotics and antiprotzoal agents effective against multiresistant strains, prepared using bacteria of genus Verrucosisporea.

Disclosure; SEQ ID NO 1; 47pp; German.

This invention describes novel polycyclic macrolactones and their derivatives, prepared using bacteria of genus Verrucosisporea and designated abyssomicins. The polycyclic macrolactones have at least one oxo-bicyclo system as a partial structure and at least one Michael system as a double bond system. The polycyclic macrolactones are prepared by culturing Verrucosisporea strain AB 18-032, recovering a culture supernatant from the culture, optionally preparing a culture filtrate and optionally isolating one or more polycyclic macrolactones from the supernatant and/or filtrate. Alternatively the microorganism is cultured followed by isolating one or more polycyclic macrolactones from the microorganism. The Verrucosisporea strain AB 18-032 was isolated from marine sediment collected at a depth of 1000m in Sagami Bay in the Japanese Sea and is deposited as DSM No. 15899. The polycyclic macrolactones inhibit the biosynthesis of p-Aminobenzoic acid, (an essential component in the biosynthesis of folic acid) from chorismic acid, thus inhibiting folic acid biosynthesis. The vitamin folic acid is essential to the life of microorganisms, especially prokaryotes and protozoa. The polycyclic macrolactones do not inhibit the biosynthesis of folic acid in mammals (including humans), and thus have no adverse effects on mammalian cells. Three polycyclic macrolactones are specifically claimed, i.e. abyssomicin B, abyssomicin C and abyssomicin D. Abyssomicin C strongly inhibited growth of methicillin-resistant Staphylococcus aureus strain N315 and vancomycin-resistant Staphylococcus aureus strain Mu50. The products of the invention are useful as antibiotics (especially effective against Gram positive bacteria) and antiprotzoal agents, specifically effective against bacteria and protozoa resistant (especially multi-resistant) to conventional antibiotics. Typically polycyclic macrolactones are useful for combating tropical protozoal diseases (e.g. malaria, leishmaniasis, sleeping sickness and Chagas disease) and infections caused by resistant Gram positive bacteria such as methicillin- and vancomycin-resistant Staphylococcus aureus strains. Polycyclic macrolactones are also useful as disinfectants (especially in hospitals and other medical establishments) and as lead structures for the development of further active agents. This sequence represents the Verrucosisporea strain AB 18-032 16S rRNA DNA which is used to phylogenically classify the bacterial strain.

XX
XX Determining a bacterium species comprises providing oligonucleotide
PT primer set comprising SEQ-FOR and SEQ-REV in a complementary fashion.
XX
XX Disclosure; SEQ ID NO 7; 74pp; English.
XX
XX The invention relates to a method (M1) for determining a bacterium
CC species. (M1) comprises: (a) culturing a bacterium from a specimen; (b)
CC extracting a genomic nucleotide from the bacterium to provide a
CC nucleotide template; (c) annealing a region of a nucleotide template to a
CC specific oligonucleotide primer set comprising SEQ-FOR and SEQ-REV in a
CC complementary fashion, the primer set designed to provide a product
CC having a predetermined size dictated by a complementary primer set; (d)
CC amplifying the region of the nucleotide template to produce the product;
CC and (e) determining a species of a bacterium in a nucleotide sequence of
CC the product. Also described is an alternative method (M2) for determining
CC a bacterium species comprising: (a) providing a specimen or a sample
CC having a template; (b) providing a pair of primers selected from: (i) a
CC first forward primer having consecutive bases of an AFB-f comprising any
CC of the 36 sequences of 15-22 bp (AEA22417-AEA22452), or their fragments
CC or variations and a first reverse primer having consecutive bases of an
CC AFB-r comprising any of the 36 sequences of 15-22 bp (AEA22453-AEA22488)
CC or their fragments or variations, (ii) a second forward primer having
CC consecutive bases of an UB-f comprising any of the 28 sequences of 15-21
CC bp (AEA22489-AEA22516) or their fragments or variations and a second
CC reverse primer having consecutive bases of an UB-r comprising any of the
CC 28 sequences of 15-21 bp (AEA22517-AEA22544) or their fragments or
CC variations, or (iii) a first forward primer having consecutive bases of
CC an AFB-f of AEA22417-AEA22452 or their fragments or variations and a
CC second reverse primer having consecutive bases of an UB-r of AEA22517-
CC AEA22544 or their fragments or variations; (c) the specimen; and (d)
CC comparing the product from the specimen with a nucleotide sequence from a
CC database to determine the bacterium species present in the specimen. The
CC methods are useful for determining a bacterium species. The present
CC sequence represents a Mycobacterium goodii 16S rRNA nucleotide
CC sequence, which is used in the exemplification of the present invention.

XX Detection of mycobacteria by shift mobility assay.
XX PT
XX Disclosure; Fig 7; 20pp; English.
XX
XX The invention describes a new method for diagnosis, identification and
XX characterisation of Mycobacterium tuberculosis or any other mycobacteria
XX by using polymerase chain reaction (PCR) and shift mobility assay (SMA)
XX in urea-polyacrylamide gel (UPAGE) comprises culturing, DNA extraction,
XX DNA amplification and shift mobility assay. The method is based on
XX divergence in sequences found in 16S rRNA to identify mycobacteria
XX species, since a remarkable shift of heteroduplex bands are obtained
XX between single stranded and homoduplex bands in UPAGE. The method is
XX fast, simple and can produce information not easily obtained when
XX compared with other detection methods. The sensitivity of other assays
XX suffer due to the tendency of the denatured PCR product strands to
XX reassociate and exclude oligonucleotide probes, and stearic interference
XX between the bound oligonucleotides and the solid support which impede
XX hybridization to nucleic acids in solution. Sequences AAX99193-237
XX represent 16S rRNA gene regions of some mycobacterial species

XX
XX Detection of mycobacteria by shift mobility assay.
XX PT
XX Disclosure; Fig 7; 20pp; English.
XX
XX The invention describes a new method for diagnosis, identification and
XX characterisation of Mycobacterium tuberculosis or any other mycobacteria
XX by using polymerase chain reaction (PCR) and shift mobility assay (SMA)
XX in urea-polyacrylamide gel (UPAGE) comprises culturing, DNA extraction,
XX DNA amplification and shift mobility assay. The method is based on
XX divergence in sequences found in 16S rRNA to identify mycobacteria
XX species, since a remarkable shift of heteroduplex bands are obtained
XX between single stranded and homoduplex bands in UPAGE. The method is
XX fast, simple and can produce information not easily obtained when
XX compared with other detection methods. The sensitivity of other assays
XX suffer due to the tendency of the denatured PCR product strands to
XX reassociate and exclude oligonucleotide probes, and stearic interference
XX between the bound oligonucleotides and the solid support which impede
XX hybridization to nucleic acids in solution. Sequences AAX99193-237
XX represent 16S rRNA gene regions of some mycobacterial species

```

CC The present invention relates to probes (ADP93908-ADP94059) for the  
 CC specific detection and identification of harmful microorganisms in  
 CC samples of foods and drug compositions. The probe sequences are derived  
 CC from the V1, V2 and/or V3 regions of the 16S rRNA of the microorganism,  
 CC or its complementary sequence. Detection and identification of the  
 CC microorganism is by amplification of the complete 16S rRNA gene using  
 CC primers ADP94060 and ADP94061, labelling the amplification product (a  
 CC fluorescence label is preferred), and hybridising to the probe or probes  
 CC of the invention. The probes may be immobilised on a DNA chip. The  
 CC microorganism is selected from Actinobacillus actinomycetemcomitans,  
 CC Acinetobacter calcoaceticus, Haemophilus influenzae, Stenotrophomonas  
 CC maltophilia, Proteus mirabilis, Streptococcus pneumoniae, Pseudomonas  
 CC aeruginosa, Citrobacter freundii, Veillonella parvula, Providencia  
 CC stuartii, Neisseria gonorrhoeae, Streptococcus agalactiae, Morganella  
 CC morganii, Bacteroides fragilis, Staphylococcus hominis, Staphylococcus  
 CC warneri, Staphylococcus haemolyticus, Enterobacter cloacae, Enterobacter  
 CC aerogenes, Staphylococcus epidermidis, Streptococcus constellatus,  
 CC Serratia marcescens, Streptococcus anginosus, Escherichia coli,  
 CC Klebsiella pneumoniae, Enterococcus faecalis, Enterococcus faecium,  
 CC Streptococcus sanguis, Streptococcus mitis, Streptococcus intermedius,  
 CC Listeria monocytogenes, Clostridium perfringens, Corynebacterium  
 CC aquaticum, Streptococcus oralis, Staphylococcus aureus, Neisseria  
 CC meningitidis, Campylobacter fetus, Enterococcus gallinarum, Enterococcus  
 CC casseliflavus, Aeromonas hydrophila, Salmonella paratyphi, Salmonella  
 CC typhi, Streptococcus equisimilis, Streptococcus canis, Klebsiella  
 CC oxytoca, Staphylococcus saprophyticus, Pasteurella multocida, Eikenella  
 CC corrodens, Streptococcus pyogenes, Moraxella catarrhalis, Legionella  
 CC pneumophila, Mycobacterium tuberculosis, Mycobacterium avium,  
 CC Mycobacterium intracellulare, Mycobacterium kansasii or Mycobacterium  
 CC gordonae.

 XX PT New single-stranded oligonucleotide, useful for amplifying the nucleic  
 PT acid of Mycobacterium avium, Mycobacterium intracellulare, and  
 PT Mycobacterium kansasii.

XX Example 1; SEQ ID NO 4; 14pp; Japanese.

XX The invention relates to a novel single-stranded oligonucleotide used in  
 CC a detection method of an atypical mycobacteria group. The invention  
 CC further includes: amplifying the nucleic acid of Mycobacterium avium by a  
 CC loop-mediated isothermal amplification (LAMP) method; amplifying the  
 CC nucleic acid of M. intracellulare by a LAMP method; amplifying the  
 CC nucleic acid of M. kansasii by a LAMP method; and a kit for detecting the  
 CC nucleic acid of M. avium by a LAMP method; detecting the nucleic acid of  
 CC M. intracellulare by a LAMP method; or detecting the nucleic acid of M.  
 CC kansasii by a LAMP method. The single-stranded oligonucleotide is useful  
 CC in medical applications. This polynucleotide represents a Mycobacterium  
 CC avium partial 16S rDNA sequence amplified by the LAMP method of the  
 CC invention.

Method for stabilizing and storing reaction reagents for specific  
 PT amplification and detection of nucleic acids particularly in e.g.  
 PT identifying pathogenic microorganisms or viruses in sample.

XX Example 15; Page 109; 177pp; Japanese.

XX The invention relates to a novel stabilising reaction reagent for use in  
 CC the amplification and/or detection of a target nucleic acid comprising:  
 CC preparing a reaction mixture with e.g. a nucleic acid as template, at  
 CC least 1 primer and RNaseH; and incubation of the reaction mixture for a  
 CC defined period of time to form a reaction product during the  
 CC amplification of such target nucleic acid. The method is useful for  
 CC stabilising and long-term storage of reaction reagents for highly  
 CC sensitive and specific amplification and detection of nucleic acids

CC particularly in identifying pathogenic microorganisms or viruses in a  
CC sample using chimeric oligonucleotide primers, which is useful in genetic  
CC engineering and clinical medicine. This polynucleotide sequence  
CC represents an oligo relating to the novel stabilising reaction reagent  
CC method of the invention

XX Determining a bacterium species comprises providing oligonucleotide

XX primer set comprising SEQ-FOR and SEQ-REV in a complementary fashion.

XX Disclosure; SEQ ID NO 12; 74pp; English.

XX The invention relates to a method (M1) for determining a bacterium

XX species. (M1) comprises: (a) culturing a bacterium from a specimen; (b)

XX extracting a genomic nucleotide from the bacterium to provide a

XX nucleotide template; (c) annealing a region of a nucleotide template to a

XX specific oligonucleotide primer set comprising SEQ-FOR and SEQ-REV in a

XX complementary fashion, the primer set designed to provide a product

XX having a predetermined size dictated by a complementary primer set; (d)

XX amplifying the region of the nucleotide template to produce the product;

XX and (e) determining a species of a bacterium in a nucleotide sequence of

XX the product. Also described is an alternative method (M2) for determining

XX a bacterium species comprising: (a) providing a specimen or a sample

XX having a template; (b) providing a pair of primers selected from: (i) a

XX first forward primer having consecutive bases of an AFB-f comprising any

XX of the 36 sequences of 15-22 bp (AEA22417-AEA22452), or their fragments

XX or variations, and a first reverse primer having consecutive bases of an

XX AFB-r comprising any of the 36 sequences of 15-22 bp (AEA22453-AEA22488)

XX or their fragments or variations, (ii) a second forward primer having

XX consecutive bases of an UB-f comprising any of the 28 sequences of 15-21

XX bp (AEA22489-AEA22516) or their fragments or variations, and a second

XX reverse primer having consecutive bases of an UB-r comprising any of the

XX 28 sequences of 15-21 bp (AEA22517-AEA22544) or their fragments or

XX variations, or (iii) a first forward primer having consecutive bases of

CC an AFB-f of AEA22417-AEA22452 or their fragments or variations and a  
CC second reverse primer having consecutive bases of an UB-r of AEA22517-  
CC AEA22544 or their fragments or variations; (c) the specimen; and (d)  
CC comparing the product from the specimen with a nucleotide sequence from a  
CC database to determine the bacterium species present in the specimen. The  
CC methods are useful for determining a bacterium species. The present  
CC sequence represents a Mycobacterium lentiflavum 16S rRNA nucleotide  
CC sequence, which is used in the exemplification of the present invention.

 XX  
 DR Depleting or isolating targeted nucleic acids e.g. rRNA, involves using a  
 XX bridging oligonucleotide comprising bridging region and a targeting  
 PT region complementary to a targeted nucleic acid, and a capture  
 PT oligonucleotide.  
 XX  
 PS Claim 4; Page 168; 208pp; English.  
 XX  
 CC This invention relates to a novel method for isolating, depleting or  
 CC separating a targeted nucleic acid, such as rRNA, from a sample  
 CC comprising targeted and non-targeted nucleic acids. It effects a way of  
 CC enriching for non-targeted nucleic acids such as mRNAs. Isolating  
 CC sufficient quantities of high quality bacterial mRNA is a demanding  
 CC process which impedes analysis of bacterial gene expression in the  
 CC presence of host cells. A small percentage of bacterial mRNAs may be poly  
 CC -A tailed, but these are targeted for degradation and tend to be  
 CC unstable. As a result, the commonly employed method for mRNA purification  
 CC with eukaryotic cells, oligo-dT capture, is ineffective. The present  
 CC invention provides an alternative, more suitable method for mRNA  
 CC purification from prokaryotes. The method of the invention comprises the  
 CC incubation of a sample with a bridging oligonucleotide (containing a  
 CC targeting region) and subsequently incubating with a capture  
 CC oligonucleotide allowing the isolation of the target from the sample. The  
 CC method is useful for depleting or isolating targeted nucleic acid, for  
 CC example rRNA such as prokaryotic 16S or prokaryotic 23S, eukaryotic 17S  
 CC or 18S or eukaryotic 28S rRNA, from a sample. The rRNA sequence may  
 CC comprise any one of 64 fully defined sequences as given in the  
 CC specification. The present sequence is that of a DNA sequence which  
 CC represents the sequence of 16S rRNA of Mycobacterium avium related to the  
 CC invention.

XX Differentiating acid-fast bacterium e.g., Mycobacterium avium complex,
XX useful for detecting mutant of M.avium complex, and for grouping strains
XX of M.kansasii, involves detecting mutation in 16S rRNA gene of acid-fast
XX bacterium.
XX
XX Claim 3; SEQ ID NO 1; 23pp; Japanese.
XX
XX This invention relates to a novel method of differentiating acid-fast
XX bacterium, which involves detecting a mutation in the 16S rRNA gene of
XX the acid-fast bacterium. The method is useful for differentiating acid-
XX fast bacterium such as M avium complex (MAC) or M kansasii, in particular
XX for detecting mutants of MAC, and for grouping strains of M kansasii. The
XX method is also useful for carrying out taxonomic-tree analysis of
XX atypical-mycobacteria and enables detection of MAC accurately and
XX reliably. The present sequence is that of a Mycobacterium 16S rRNA gene
XX which may be used in the method of the invention.

XX New single-stranded oligonucleotide, useful for amplifying the nucleic
XX acid of Mycobacterium avium, Mycobacterium intracellulare, and
XX Mycobacterium kansasii.
XX
XX Claim 1; SEQ ID NO 13; 14pp; Japanese.
XX
XX
XX The invention relates to a novel single-stranded oligonucleotide used in
XX a detection method of an atypical mycobacteria group. The invention
XX further includes: amplifying the nucleic acid of Mycobacterium avium by a
XX loop-mediated isothermal amplification (LAMP) method; amplifying the
XX nucleic acid of M. intracellulare by a LAMP method; amplifying the
XX nucleic acid of M. kansasii by a LAMP method; and a kit for detecting the
XX nucleic acid of M. avium by a LAMP method; detecting the nucleic acid of
XX M. intracellulare by a LAMP method; or detecting the nucleic acid of M.
XX kansasii by a LAMP method. The single-stranded oligonucleotide is useful
XX in medical applications. This oligo sequence represents a loop-mediated
XX isothermal amplification (LAMP) primer used in the exemplification of the
XX invention.

XX
XX Fragments of Corynebacterium 16S RNA - useful as probes and primers for
XX identifying Corynebacterium spp.
XX
XX Claim 1; Fig 1; 60pp; French.
XX
XX Fragments covering 90 % of the sequence of 16S ribosomal RNA were
XX amplified from 28 strains of 25 different species of Corynebacterium by
XX PCR using primers specific for eubacteria. The amplification products
XX were sequenced and the sequences were aligned for comparison. It was
XX found that certain regions, i.e. those corresponding to nucleotides 72-
XX 100, 195-215, 466-494, 608-631, 838-853, 859-875 and 1013-1033 in the 16S
XX ribosomal RNA of C. diphtheriae (refer to features table for the present
XX sequence), vary considerably between different species. Probes and
XX primers comprising at least 5 nucleotides from one of these species-
XX specific sequences, including the present sequence, or their complements,
XX are useful to distinguish between different Corynebacterium species. DNA
XX versions of the probes and primers are also included

XX
XX Propionibacterium acnes polypeptides and nucleic acids useful for
XX vaccinating against and diagnosing infections, especially useful for
XX treating acne vulgaris.
XX
XX Claim 1; SEQ ID NO 35; 1069pp; English.
XX
XX Sequences AAS59506-AAS59804 represent DNA molecules encoding
XX Propionibacterium acnes immunogenic polypeptides. The proteins and their
XX associated DNA sequences are used in the treatment, prevention and
XX diagnosis of medical conditions caused by P. acnes. The disorders include
XX SAPHO syndrome (synovitis, acne, pustulosis, hyperostosis and
XX osteomyelitis), uveitis and endophthalmitis. P. acnes is also involved in
XX infections of bone, joints and the central nervous system, however it is
XX particularly involved in the inflammatory lesions associated with acne
XX vulgaris. A method for detecting the presence or absence of P. acnes in a
XX patient comprises contacting a sample with a binding agent that binds to
XX the proteins of the invention and determining the amount of bound protein
XX in the sample. The polypeptides may be used as antigens in the production
XX of antibodies specific for P. acnes proteins. These antibodies can be
XX used to downregulate expression and activity of P. acnes polypeptides and
XX therefore treat P. acnes infections. The antibodies may also be used as
XX diagnostic agents for determining P. acnes presence, for example, by
XX enzyme linked immunosorbent assay (ELISA). This sequence encodes the
XX polypeptides shown in AAU47822-AAU47846. Note: The sequence data for this
XX patent did not form part of the printed specification, but was obtained
XX in electronic format directly from WIPO at

XX
XX New Propionibacterium acnes polypeptides and polynucleotides encoding the
XX polypeptide, useful for diagnosing, preventing or treating acne vulgaris,
XX or for stimulating an immune response specific for a P. acnes protein.
XX
XX Claim 1; SEQ ID NO 35; 1481pp; English.
XX
XX The invention relates to an isolated polynucleotide (ACF64435-ACF64733)
XX encoding a Propionibacterium acnes protein. The invention also relates to
XX polypeptides encoded by the polynucleotides (ABM35624-ABM64536) and to
XX immunogenic fragments of P. acnes polypeptides. The invention
XX additionally encompasses expression vectors and host cells comprising a
XX polynucleotide of the invention; antibodies against polypeptides of the
XX invention; fusion proteins comprising a polypeptide of the invention; a
XX method for stimulating an immune response specific for a P. acnes
XX polypeptide and an isolated T cell population comprising T cells prepared
XX via this method; a vaccine composition (comprising P. acnes polypeptides,
XX polynucleotides, antibodies, fusion proteins, T cell populations, or
XX antigen-presenting cells that express the polypeptide); a method and kit
XX for detecting or determining the presence or absence of P. acnes in a
XX patient; and a method for inhibiting the development of P. acnes in a
XX patient. The P. acnes polypeptides, polynucleotides, antibodies, fusion
XX proteins, T cell populations or antigen-presenting cells that express the
XX polypeptides are useful for diagnosing, preventing or treating acne
XX vulgaris, or for stimulating an immune response specific for a P. acnes
XX protein. The polynucleotides can also be used as probes or primers for
XX nucleic acid hybridisation. The vaccine composition is useful for the
XX stimulation of an immune response against P. acnes, or for treating acne,
XX and the kit is useful for performing a diagnostic assay. The present
XX sequence represents a P. acnes DNA contig which is specifically claimed
XX in the invention. Note: The sequence data for this patent did not form
XX part of the printed specification, but was obtained in electronic format
XX directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

XX	
CC	The invention describes a new method for diagnosis, identification and characterisation of Mycobacterium tuberculosis or any other mycobacteria by using polymerase chain reaction (PCR) and shift mobility assay (SMA) in urea-polyacrylamide gel (UPAGE) comprises culturing, DNA extraction, DNA amplification and Shift mobility assay. The method is based on divergence in sequences found in 16S rRNA to identify mycobacteria species, since a remarkable shift of heteroduplex bands are obtained between single stranded and homoduplex bands in UPAGE. The method is fast, simple and can produce information not easily obtained when compared with other detection methods. The sensitivity of other assays reassociate and exclude oligonucleotide probes, and stearic interference between the bound oligonucleotides and the solid support which impede hybridization to nucleic acids in solution. Sequences AAX99193-237 represent 16S rRNA gene regions of some mycobacterial species

XX Novel microorganism strains YS-44442 and YS-45494 of Saccharothrix,
XX useful for producing pravastatin.
XX
XX Example 1; SEQ ID NO 1; 16pp; English.
XX
XX The present invention relates to the isolation of novel microorganism
XX strains of Saccharothrix designated YS-44442 and YS-45494. Also disclosed
XX is a method for isolating 3-hydroxy-3-methylglutaryl (HMG)-CoA reductase
XX inhibitors such as pravastatin. The Saccharothrix strains YS-44442 and YS
XX -45494 are useful for producing pravastatin. The method involves
XX cultivating the strains at a suitable condition to generate a
XX fermentation broth, feeding compactin into the broth, fermenting the
XX broth for a period of time to convert the compactin to pravastatin, and
XX isolating the pravastatin from the broth. The fermentation broth is
XX cultivated for less than 2 days, preferably for 18 hours. The
XX fermentation broth is derived from a seed culture of the microorganism
XX which is cultivated at a suitable condition for 18-48 hours before
XX inoculation into the broth. The broth is fermented for less than 5 days,
XX preferably 3 days, most preferably less than 24 hours. The method of the
XX invention is useful for isolating HMG-CoA reductase inhibitor such as
XX pravastatin, compactin or lovastatin, preferably pravastatin. The
XX pravastatin or HMG-CoA reductase inhibitors are useful for reducing blood
XX cholesterol levels. The present sequence represents Saccharothrix strain
XX YS-44442 16S rDNA sequence.

 DR Novel nucleic acid fragment useful for converting ketone substrates to  
 XX the corresponding lactone or ester, is isolated from Rhodococcus,  
 PT Arthrobacter or Acidovorax, encoding Baeyer-Villiger monooxygenase  
 PT polypeptide.  
 XX PS Claim 54; SEQ ID NO 6; 225pp; English.  
 XX CC The invention relates to a novel isolated nucleic acid fragment  
 CC comprising a fragment encoding a Baeyer-Villiger (BV) monooxygenase  
 CC polypeptide having a sequence of 542, 541, 439, 518, 462, 531, 493, 539,  
 CC 649, 494, 499, 545, 532 or 538 amino acids defined in the specification;  
 CC a nucleic acid molecule that hybridises with the above sequence under the  
 CC hybridisation conditions; or their complements. The BV monooxygenase  
 CC fragment is useful for obtaining a nucleic acid fragment encoding a BV  
 CC monooxygenase polypeptide, by probing a genomic library with the  
 CC fragment, identifying a DNA clone that hybridises with the fragment, and  
 CC sequencing the genomic fragment that comprises the above identified  
 CC clone, where the sequenced genomic fragment encodes a BV monooxygenase  
 CC polypeptide. The genes and their products are useful for converting  
 CC suitable ketone substrates to the corresponding lactone or ester. This  
 CC polynucleotide sequence represents the 16s rDNA gene from Arthrobacter  
 CC sp. BP2 relating to the Baeyer-Villiger enzymes of the invention.

XX		XX	Disclosure; SEQ ID NO 11; 133pp; English.
CC	The present invention relates to probes (ADF93908-ADF94059) for the	XX	
CC	specific detection and identification of harmful microorganisms in	CC	This invention describes a novel method for obtaining sequence
CC	samples of foods and drug compositions. The probe sequences are derived	CC	information from a target biomolecule and involves fragmenting the target
CC	from the V1, V2 and/or V3 regions of the 16S rRNA of the microorganism,	CC	biomolecule into several fragments by partial cleavage, performing mass
CC	or its complementary sequence. Detection and identification of the	CC	spectrometry on fragments to produce mass spectra, extracting peak
CC	microorganism is by amplification of the complete 16S rRNA gene using	CC	information from the produced mass spectra, constructing sequencing graph
CC	primers ADF94060 and ADF94061, labelling the amplification product (a	CC	using the extracted peak information and traversing the sequencing graphs
CC	fluorescence label is preferred), and hybridising to the probe or probes	CC	to reconstruct sequence information of the target biomolecule. The target
CC	of the invention. The probes may be immobilised on a DNA chip. The	CC	biomolecule is nucleic acid molecule such as DNA or RNA, or is a protein
CC	microorganism is selected from Actinobacillus actinomycetemcomitans,	CC	and the compositions of the two fragments are the base compositions or
CC	Acinetobacter calcoaceticus, Haemophilus influenzae, Stenotrophomonas	CC	amino acid compositions. This method preferably involves subjecting the
CC	maltophilia, Proteus mirabilis, Streptococcus pneumoniae, Pseudomonas	CC	nucleic acid molecule to partial cleavage reactions with one or more
CC	aeruginosa, Citrobacter freundii, Veillonella parvula, Providencia	CC	specific cleavage reagents, thus generating two or more fragments that
CC	stuartii, Neisseria gonorrhoeae, Streptococcus agalactiae, Moraxella	CC	are specific cleavage products, determining the molecular weights of the
CC	morganii, Bacteroides fragilis, Staphylococcus hominis, Staphylococcus	CC	two or more fragments, determining the possible base compositions of the
CC	warneri, Staphylococcus haemolyticus, Enterobacter cloacae, Enterobacter	CC	two or more fragments, ordering the possible base compositions of the two
CC	aerogenes, Staphylococcus epidermidis, Streptococcus constellatus,	CC	or more fragments according to the number of specific cleavage sites that
CC	Serratia marcescens, Streptococcus anginosus, Escherichia coli,	CC	are not cleaved in each fragment, constructing one or more sequencing
CC	Klebsiella pneumoniae, Enterococcus faecalis, Enterococcus faecium,	CC	graphs that are a graph theoretical representation of the ordered base
CC	Streptococcus sanguis, Streptococcus mitis, Streptococcus intermedius,	CC	compositions for the two or more fragments, and traversing the one or
CC	Listeria monocytogenes, Clostridium perfringens, Corynebacterium	CC	more sequencing graph to reconstruct one or more underlying sequence
CC	aquatum, Streptococcus oralis, Staphylococcus aureus, Neisseria	CC	candidates, where each sequencing graph corresponds to the ordered base
CC	meningitidis, Campylobacter fetus, Enterococcus gallinarum, Enterococcus	CC	compositions derived from a partial cleavage reaction with one base-
CC	caseielliflavus, Aeromonas hydrophila, Salmonella paratyphi, Salmonella	CC	specific cleavage reagent. This method further involves scoring the one
CC	typhi, Streptococcus equisimilis, Streptococcus canis, Klebsiella	CC	or more underlying sequence candidates and determining the rank order of
CC	oxytoca, Staphylococcus saprophyticus, Pasteurella multocida, Eikenella	CC	fitness, where the scoring is done by statistical analysis or maximum
CC	corrodens, Streptococcus pyogenes, Moraxella catarrhalis, Legionella	CC	likelihood statistical analysis. This method determines epigenetic
CC	pneumophila, Mycobacterium tuberculosis, Mycobacterium avium,	CC	changes in a target nucleic acid molecule relative to reference nucleic
CC	Mycobacterium intracellulare, Mycobacterium kansasii or Mycobacterium	CC	acid molecule and allows the sequencing of large biomolecules. The
XX	gordonae.	CC	invention also describes a method of producing a candidate sequence of a
XX		CC	biomolecule which involves receiving several sequencing graphs having
XX		CC	several vertices and edges, where each vertex represents a compomer of
XX		CC	the biomolecule and each edge represents a cut base of the sequencing
XX		CC	graph and generating the candidate sequence by traversing several
XX		CC	sequencing graphs. This second method further involves traversing several
XX		CC	sequencing graphs by tracing through each sequencing graph, starting at a
XX		CC	source vertex. The results of each method can be read by a program
XX		CC	product for use in a computer that executes program instructions recorded
XX		CC	in a computer-readable media to produce a candidate sequence of a
XX		CC	biomolecule or to obtain sequence information in a target biomolecule.
XX		CC	The target biomolecule contains a sequence variation, which is a mutation
XX		CC	or a polymorphism. The target is a target nucleic acid molecule from an
XX		CC	organism chosen from eukaryotes, prokaryotes and viruses, preferably a
XX		CC	bacterium. The specific cleavage reagent is an RNase chosen from RNase
XX		CC	T1, RNase U2, RNase PhnM, RNase A, chicken liver RNase (RNase CL3) and
XX		CC	cusavitin, or a glycosylase. The sequence variations in the target
XX		CC	biomolecule permit genotyping a subject, forensic analysis, disease

DR Method for stabilizing and storing reaction reagents for specific

XX amplification and detection of nucleic acids particularly in e.g.

PT identifying pathogenic microorganisms or viruses in sample.

PT Example 15; Page 110; 177pp; Japanese.

XX The invention relates to a novel stabilising reaction reagent for use in

CC the amplification and/or detection of a target nucleic acid comprising:

CC preparing a reaction mixture with e.g. a nucleic acid as template, at

CC least 1 primer and RNaseH, and incubation of the reaction mixture for a

CC defined period of time to form a reaction product during the

CC amplification of such target nucleic acid. The method is useful for

CC stabilising and long-term storage of reaction reagents for highly

CC sensitive and specific amplification and detection of nucleic acids

CC particularly in identifying pathogenic microorganisms or viruses in a

CC sample using chimeric oligonucleotide primers, which is useful in genetic

CC engineering and clinical medicine. This polynucleotide sequence

CC represents an oligo relating to the novel stabilising reaction reagent

CC method of the invention

 XX  
 XX The invention relates to a method (M1) for determining a bacterium  
 XX species. (M1) comprises: (a) culturing a bacterium from a specimen; (b)  
 XX extracting a genomic nucleotide from the bacterium to provide a  
 XX nucleotide template; (c) annealing a region of a nucleotide template to a  
 XX specific oligonucleotide primer set comprising SEQ-FOR and SEQ-REV in a  
 XX complementary fashion, the primer set designed to provide a product  
 XX having a predetermined size dictated by a complementary primer set; (d)  
 XX amplifying the region of the nucleotide template to produce the product;  
 XX and (e) determining a species of a bacterium in a nucleotide sequence of  
 XX the product. Also described is an alternative method (M2) for determining  
 XX a bacterium species comprising: (a) providing a specimen or a sample  
 XX having a template; (b) providing a pair of primers selected from: (i) a  
 XX first forward primer having consecutive bases of an AFB-f comprising any  
 XX of the 36 sequences of 15-22 bp (AEA22417-AEA22452), or their fragments  
 XX or variations; and a first reverse primer having consecutive bases of an  
 XX AFB-r comprising any of the 36 sequences of 15-22 bp (AEA22453-AEA22488)  
 XX or their fragments or variations; (ii) a second forward primer having  
 XX consecutive bases of an UB-f comprising any of the 28 sequences of 15-21  
 XX bp (AEA22489-AEA22516) or their fragments or variations; and a second  
 XX reverse primer having consecutive bases of an UB-r comprising any of the  
 XX 28 sequences of 15-21 bp (AEA22517-AEA22544) or their fragments or  
 XX variations; or (iii) a first forward primer having consecutive bases of  
 XX an AFB-f of AEA22417-AEA22452 or their fragments or variations; and a  
 XX second reverse primer having consecutive bases of an UB-r of AEA22517-  
 XX AEA22544 or their fragments or variations; (c) the specimen; and (d)  
 XX comparing the product from the specimen with a nucleotide sequence from a  
 XX database to determine the bacterium species present in the specimen. The  
 XX methods are useful for determining a bacterium species. The present  
 XX sequence represents a Mycobacterium paraffinicum 16S rRNA nucleotide  
 XX sequence, which is used in the exemplification of the present invention.

 XX Production of seasoning liquors with the flavor of vegetables pickled in  
 XX salted rice bran.  
 XX  
 XX Disclosure; Page 41-43; 45pp; Japanese.  
 XX  
 XX The invention relates to a method of producing seasoning liquors with the  
 XX flavour of vegetables pickled in salted rice bran paste by culturing a  
 XX microorganism in a rice bran dispersion to produce gamma-dodecalactone  
 XX and/or gamma-dodecalactone. The microorganism produces lactic acid,  
 XX propionic acid, gamma-dodecalactone and/or gamma-dodecalactone. The  
 XX microorganism is especially a novel strain of Corynebacterium (strain NK-  
 XX 1, FERM BP-6329) with properties defined in the specification. This  
 XX sequence represents the 16S rRNA gene from the novel Corynebacterium  
 XX strain. The seasoning liquor is used for preparing a salted rice bran  
 XX pickle bed which provides pickles

 XX Disclosure; SEQ ID NO 1; 16pp; Japanese.  
 XX  
 XX This invention relates to a novel Gordonia genus Actinomyces which has  
 CC ammonia utilising ability and nitrous acid oxidation ability. The  
 CC invention may be useful for purifying fresh water and seawater, of  
 CC particular use in raising ayu fish, flatfish, blowfish and gold fish. The  
 CC Gordonia genus actinomyces effectively suppresses concentration of  
 CC ammonia and nitrous acid in fresh water and seawater, and provides  
 CC purified water that is favourable for raising fishes.

XX Detecting Mycobacterium species, involves in vitro amplification of 16S  
 PT rRNA or DNA encoding RNA in nucleic acid amplification mixture using  
 PT specific primers, and detecting the amplified nucleic acid.

XX Claim 1; Page 35; 44pp; English.

XX The invention relates to a method of detecting Mycobacterium species,  
 CC that involves amplifying Mycobacterium 16S ribosomal RNA (rRNA) or DNA  
 CC encoding 16S rRNA in an in vitro nucleic acid amplification mixture  
 CC comprising a polymerase, and at least two primers, and then detecting the  
 CC amplified nucleic acid. The method is relatively simple and useful for  
 CC detecting the presence of various Mycobacterium species in a biological  
 CC sample, and thus important for diagnosis of infections resulting from  
 CC them. The method is especially important for screening opportunistic  
 CC infections caused by M. tuberculosis or a Mycobacterium other than  
 CC tuberculosis (MOTT). The present sequence is a PCR primer used for  
 CC amplifying Mycobacterium 16S rRNA

XX  
CC The present invention relates to probes (ADF93908-ADF94059) for the  
CC specific detection and identification of harmful microorganisms in  
CC samples of foods and drug compositions. The probe sequences are derived  
CC from the V1, V2 and/or V3 regions of the 16S rRNA of the microorganism,  
CC or its complementary sequence. Detection and identification of the  
CC microorganism is by amplification of the complete 16S rRNA gene using  
CC primers ADF94060 and ADF94061, labelling the amplification product (a  
CC fluorescence label is preferred), and hybridising to the probe or probes  
CC of the invention. The probes may be immobilised on a DNA chip. The  
CC microorganism is selected from Actinobacillus actinomycetemcomitans,  
CC Acinetobacter calcoaceticus, Haemophilus influenzae, Stenotrophomonas  
CC maltophilia, Proteus mirabilis, Streptococcus pneumoniae, Pseudomonas  
CC aeruginosa, Citrobacter freundii, Veillonella parvula, Providencia

 XX Novel oligo-nucleotide(s) which hybridise with the 16S rRNA gene of  
 XX bacteria - used for detection and identification of acid-fast bacteria,  
 PT eg. Mycobacterium.  
 XX  
 PS Claim 1; Page 10; 13pp; Japanese.  
 XX

CC AQ094743-46 are oligonucleotides used for the detection and  
 CC identification of acid-fast bacteria (pref. Mycobacterium) by hybridising  
 CC with the base sequence of the 16S rRNA gene of the bacteria. The  
 CC oligonucleotides can be represented by all or a part of the 203 base  
 CC sequence shown here. Mycobacteria are gram-positive bacteria which grow  
 CC very slowly and require a lot of time for culture for detection (longer  
 CC than one month). The probes provide a simple, rapid and exact method for  
 CC detection and identification of the bacteria. The method can be applied  
 CC directly to sputum or blood samples and the result obtd. within one day.  
 CC AQ094747-60 are specific probes for different Mycobacteria species

 PT New single-stranded oligonucleotide, useful for amplifying the nucleic  
 PT acid of Mycobacterium avium, Mycobacterium intracellulare, and  
 PT Mycobacterium kansasii.  
 XX  
 PS Example 1; SEQ ID NO 6; 14pp; Japanese.

CC The invention relates to a novel single-stranded oligonucleotide used in  
 CC a detection method of an atypical mycobacteria group. The invention  
 CC further includes: amplifying the nucleic acid of Mycobacterium avium by a  
 CC loop-mediated isothermal amplification (LAMP) method; amplifying the  
 CC nucleic acid of M. intracellulare by a LAMP method; amplifying the  
 CC nucleic acid of M. kansasii by a LAMP method; and a kit for detecting the  
 CC nucleic acid of M. avium by a LAMP method; detecting the nucleic acid of  
 CC M. intracellulare by a LAMP method; or detecting the nucleic acid of M.  
 CC kansasii by a LAMP method. The single-stranded oligonucleotide is useful  
 CC in medical applications. This polynucleotide represents a Mycobacterium  
 CC kansasii partial 16S rDNA sequence amplified by the LAMP method of the  
 CC invention.

 DR A nucleic acid sequence useful for diagnosing pathogenic bacteria for  
 PT meningitides.  
 PT  
 XX Disclosure; Page 18; 24pp; Chinese.  
 PS  
 XX The invention relates to a nucleic acid sequence group for quickly  
 CC diagnosing 20 kinds of pathogenic bacteria for meningitis. Its method  
 CC includes comparing the DNA sequences of different pathogenic bacteria,  
 CC choosing special fragments, finding out common primer, designing 3  
 CC specific probe fragments for each pathogenic bacterium, dotting them on  
 CC high-molecular polymer to obtain chip, sampling the DNA of pathogenic  
 CC bacterium of patient, labeling, amplification, and reacting with said  
 CC chip for visually recognizing the pathogenic bacterium. Its advantages are  
 CC high speed and low cost. The present sequence represents a meningitis  
 CC causing bacteria DNA fragment.

Martin WJ, Wisniewski P;  
 WPI; 1998-240079/21.  
 Use of oligonucleotide(s) corresponding to bacterial 16S rRNA - for  
 inhibiting bacterial protein expression and treating bacterial infection.  
 Claim 26; Page 60-61; 73pp; English.  
 This polynucleotide comprises the 16S ribosomal RNA (rRNA) gene of  
 Mycobacterium tuberculosis. The invention relates to methods and  
 compositions for the treatment of Gram-negative bacterial infections  
 employing novel oligonucleotides as antimicrobial agents. The  
 oligonucleotides are targeted to the Shine-Dalgarno (SD) region of  
 prokaryotes to inhibit bacterial expression and hence inhibit bacterial  
 infection. They preferably comprise 10-35 consecutive bases of the 3' end  
 of a bacterial 16S rRNA (see also AAV24291-95). An oligonucleotide may  
 also include a transport moiety and may have DNA phosphate modifications  
 to increase nuclease resistance, or may be formulated in a liposome. A  
 claimed method for treating a bacterial infection of a patient comprises  
 administering a liposomal formulation of such an oligonucleotide. The  
 oligonucleotides can be used particularly for treating bacterial  
 infections in pulmonary diseases such as cystic fibrosis or tuberculosis.  
 Since the SD sequence is not present in eukaryotic cells, the  
 oligonucleotides provide a pathogen-specific therapeutic method

 XX Oligonucleotide primers useful for detecting microorganisms of the genus  
 PT Mycobacterium.  
 XX  
 XX Example; Fig 3; 2lpp; English.

XX This sequence is the Mycobacterium tuberculosis 16S rRNA gene. This  
 CC sequence is used in an example of a method using oligonucleotide primers  
 CC for amplification of a genus specific sequence of the 16S rRNA gene. The  
 CC method of the invention consists of using primers AA235572-235586 to  
 CC amplify M. tuberculosis DNA and then detecting the amplified nucleic  
 CC acids. The oligonucleotides are useful for the detection of species of  
 CC medical interest of the genus Mycobacterium. In particular the detection  
 CC can be used for human and veterinary diagnosis from samples of biological  
 CC fluids or tissue e.g. sputum, bronchial washings, gastric washings,  
 CC blood, milk, lymph, skin and soft tissues. Identifying the mycobacterium  
 CC using the nucleic acid based diagnostic assay reduces the time required  
 CC for an accurate diagnosis as cultivation of the organisms is not required

 prepared and sequenced in Mouse Genome Encyclopedia  
 Project of Genome Exploration Research Group in Riken  
 Genomic Sciences Center and Genome Science Laboratory in  
 RIKEN. Division of Experimental Animal Research in Riken  
 contributed to prepare mouse tissues. 1st strand cDNA was  
 primed with a primer [5'  
 GAGAGAGAGAGATCCAGAGCTCTTTTCTTTTCTTTT 3'], cDNA was  
 prepared by using trehalose thermo-activated reverse  
 transcriptase and subsequently enriched for full-length by  
 cap-trapper. cDNA went through one round of normalization  
 to Rot = 20.0 and subtraction to Rot = 459.0. Second  
 strand cDNA was prepared with the primer adapter of  
 sequence [5' GAGAGAGAGATTCGAGTTAATAATTAATCCCCCCCCCCC  
 3']. cDNA was cleaved with XhoI and BamHI. Vector: a  
 modified pBluescript KS(+) after bulk excision from Lambda  
 FLC I."

 RNA prepared and library constructed by W. Walter Lorenz (School of Forest Resources, University of Georgia); plant material prepared by Craig Zimmermann (School of Forest Resources, University of Georgia) using rooted cuttings provided by the Forest Biology Research Cooperative (FBRC) and the CCLONES project at the University of Florida; sequencing done in the Laboratory for Genomics and Bioinformatics, University of Georgia. Sequence ends have been trimmed to exclude vector and regions below Phred quality 16. Three prime sequences are presented as their reverse complement and have been trimmed to exclude polyA.  
 Seq primer: JENREV (CAGGAACAGCTATGACC).

 /note="Organ: Root; Vector: pSL1180; Site\_1: EcoRI; Site\_2: XhoI; The library was prepared from polyA+ RNA from the roots of 1-year-old loblolly pine (Pinus taeda) cuttings that were rooted and then planted in washed sand. The rooted cuttings were maintained for 117 days (July 2003 harvest) under ambient conditions in a local greenhouse. They were kept on a weekly regimen of 0.5x nutrient-complete Hoagland's solution and supplemented with additional water sufficient to maintain a 15% soil moisture content. For twenty-eight days (28 d) prior to harvesting roots for mRNA preparation, the trees received Hoagland's solution lacking potassium (K) to induce a potassium-deficiency. Double-stranded cDNA was cloned unidirectionally into pSL1180. Inserts can be excised with EcoRI (5' end) and XhoI (3' end)."

WashU Stem cell EST Project  
Unpublished (2002)  
Contact: Jeff Gordon and Mike Lovett  
WashU, Human Genetics Division

Washington University School of Medicine  
1st strand of cDNA was synthesized with reverse transcriptase and  
oligo(dT) beads, then cDNA was amplified by PCR using modified  
SMART primers. The final cDNA was cloned in pAMP1 vector in  
annealing reaction with Uracil DNA Glycosylase (UDG). Library  
constructed by Y.Korshunova and M. Lovett. Library materials  
provided by Mills JC & Gordon JI.  
Putative full length read  
vector to vector length is  
Possible reversed clone: similarity on wrong strand  
Seq primer: -40RP from Gibco.

This is a long-transcript enriched cDNA library (Ref. Genome Res. 11: 1553-1558 (2001). [PMID: 11544199]). Total RNAs were extracted from a pool of 8 embryos at 10.5-days postcoitum. Double-stranded cDNAs were synthesized with an oligo(dT) primer (Invitrogen):  
5'-pGACTAGTCTAGACGCGAGCGCCCTTTT-3' from 2ug of total RNA, treated with T4 DNA polymerase, and purified by ethanol-precipitation. The cDNAs were ligated to Lona-linker Li-Sal4, purified by phenol/chloroform, and separated from free linkers by Centricon 100. Then, the cDNAs were amplified by long-range high fidelity PCR using Ex Taq polymerase (Takara) with a primer Sal4-S. The products were purified by phenol/chloroform and Centricon 100. The cDNAs were digested with SalI and NotI enzymes and cloned into SalI/NotI site of pCMV-SPORT6 plasmid vector. The DH10B E. coli host was transformed with the ligation mixture by the standard chemical method. The average insert size is about 3.4Kb. The library was constructed by Yulan Piao."

/clone="gll35c11"  
/sex="male and female"  
/dev\_stage="Post natal day 5 to 13"  
/clone\_lib="Mouse Organ of Corti cDNA pBluescript"

/note="Organ: Organ of Corti; Vector: pBluescript; The organ of Corti (OC) was fine dissected from a total of 386 OC as follows: 102 samples from post-natal (P) day 5; 72 from P6; 60 from P7; 46 from P8; 18 from P9; 20 from P10; 14 from P12 and 24 from P13. After killing animals by cervical dislocation followed by decapitation, the bulla was removed and opened in Leibowitz medium. The bony capsule of the cochlea was chipped away, stria vascularis and spiral ligament were removed and the sensory epithelium was carefully dissected out of the modiolus. Total RNA was extracted using the micro Fasttrack kit (catalog # K1593-02; Invitrogen, Carlsbad, CA), according to manufacturer's instructions. Reverse transcription and library construction were carried out with the Uni-Zap XR vector kit (catalog # 237211, Stratagene) and Uni-Zap XR Gigapack III Gold Cloning kit (catalog # 237612), both from Stratagene (La Jolla, CA, USA), according to manufacturer's instructions. Briefly: 1.5 ug mRNA was reverse transcribed using a hybrid oligo(dT) linker-primer that contains an Xho I site. First strand synthesis was primed with the linker- primer and transcribed using Moloney murine leukemia virus reverse transcriptase (MMLV-RT) and 5-methyl dCTP. The second strand was synthesized with DNA polymerase and RNase H. Complementary

DNA was blunt ended with Pfu DNA polymerase, ligated with EcoR I adapters in the presence of ligase and digested with Xho I. The cDNA was sequentially size fractionated over Pharmacia Size Sep400 (Pharmacia, Uppsala, Sweden) and Clontech Chroma Spin-1000 (Clontech, Palo Alto, CA) columns to enrich for cDNAs greater than 400bp and 1000 bp, respectively. The cDNA was then directionally ligated to the Uni-ZAP XR vector, which had been predigested with EcoR I and Xho I. The phagemid was packaged with Gigapak III Gold and, upon titration on XL1 Blue MRF' cells, the yield of the phage library was estimated to be 11,100,000 recombinants. Stratagene's Exassist Interference resistance helper phage (catalogue # 211203) was adopted to rescue plasmid DNA from the phages. Upon plating of the rescued library, individual cDNA clones were selected and grown in 96-well, 2 ml growth plate. Plasmid DNA was purified from 200 ul of saturated culture with the Concert96(TM) plasmid purification kit (Invitrogen, Carlsbad, CA) as instructed by the manufacturer. ESTs from the 5' end of the cDNA clones were generated with the universal M13 reverse primer (CAGGAACAGCTATGACC) and 25% strength BigDye terminator sequencing chemistry (Applied Biosystems, Foster City, CA). Sequencing reactions were performed on MJ Tetrad thermal cyclers (MJ Research, Waltham, MA), and analyzed on 3700 automated capillary sequencers using POP5 polymer (Applied Biosystems, Foster City, CA). The frequency distribution of the library is as follows: 72% of genes have 1 copy; 14.3% 2; 12% 3-10; 1.4% 11-50 and 0.1% 51-150. As to gene function, 45% of genes are present in GenBank and have known function; 23% have hits in GenBank, but do not have assigned function; 12% are uncharacterized ESTs and 20% are unidentified."

This is a long-transcript enriched cDNA library (Ref.

Genome Res. 11: 1553-1558 (2001). [PMID: 11544199]). Total

RNAs were extracted from a pool of 8 embryos at 10.5-days

postcoitum. Double-stranded cDNAs were synthesized with an

Oligo(dT) primer [Invitrogen:

5'-TGACTAGTCTAGATCGGAGCGCCCTTTTCTTTT-3'] from

2ug of total RNA, treated with T4 DNA polymerase, and

purified by ethanol-precipitation. The cDNAs were ligated

to lona-linker LL-Sal4, purified by phenol/chloroform, and

separated from free linkers by Centricon 100. Then, the

cDNAs were amplified by long-range high fidelity PCR using

Ex Taq polymerase (Takara) with a primer Sal4-S. The

products were purified by phenol/chloroform and Centricon

100. The cDNAs were digested with SalI and NotI enzymes

and cloned into SalI/NotI site of pCMV-SPORT6 plasmid

/lab\_host="XL1-Blue"

/clone\_lib="UGA-2mSAM-X22"

/note="Organ: Shoot apex; Vector: Uni-Zap XR; Site 1: EcoRI; Site 2: XhoI; This library was constructed by Xiaolan Zhang. Vegetative Shoot Apical Meristem (SAM) and leaf primordia staged P1-P4 from 14-17 day-after germination seedlings were quickly dissected into dry ice under a light microscope. Total RNA was isolated using Trizol and mRNA was purified with Dynal Oligo-DT25. ds-cDNA molecules were generated as follows. First-strand cDNA was prepared from oligo-dT selected mRNA by priming with an XhoI oligo-dT primer (5'-GAGAGAGAGAGAGAGAACTAGTCTCGAGTTTTTTTTTTTTTTT). The resulting DNA:RNA hybrid was treated with RNase H and used as a template for DNA Pol-I-catalyzed second strand synthesis. After the addition of EcoRI adaptors, the ds-cDNAs were digested with XhoI and size-selected to be >600 bp. The resulting molecules were directionally cloned into the EcoRI and XhoI sites of the Uni-Zap XR vector. The lambda library was packaged with Gigapack III Gold packaging extract and was mass excised by XL1-Blue cells and ExAssist helper phage. Excised phagemids were titered in SOLR cells and plated onto LB-ampicillin agar plates. Base calling was conducted using Phred. Trimming was performed using Lucy with the following criteria: (-minimum 200 -error 0.01 0.01 -bracket 10 0.01). A low complexity filter was applied and additional trimming was conducted to remove E. coli, vector, and organelle contamination. After processing ~30% of the sequences contained a minimum of 10 ts at the beginning of the sequence. For reasons that are not understood many of the clones in this library lack an XhoI site at their 3' ends."

Site 2: NotI; Mouse cDNA project by the Laboratory of
Genetics, National Institute on Aging (NIA), Intramural
Research Program, NIH (http://lgsun-grc.nia.nih.gov/cDNA).
This is a long-transcript enriched cDNA library (Ref.
Genome Res. 11: 1553-1558 (2001). [PMID: 11544199]). EG
cells were obtained from Dr. Brigid L.M. Hogan and RNA was
prepared by Dr. Mark G. Carter (NIH/NIA-IRP). EG cells
were cultured at 37. C. 5% CO2 in DMEM supplemented with
15% ES cell-qualified FBS, 0.1mM non-essential amino
acids, 2 mM glutamine, penicillin/streptomycin, 1 mM
sodium pyruvate, 0.1 mM beta-mercaptoethanol, and 10^-7
units of LIF per liter. Double-stranded cDNAs were
synthesized with an Oligo(dT) primer [Invitrogen:
5'-pGACTAGTCTAGATCGAGCGCGCCCTTTTTTT-3'] from
2.5 ug of total RNA, treated with T4 DNA polymerase, and
purified by ethanol-precipitation. The cDNAs were ligated
to lona-linker Li-Sal4, purified by phenol/chloroform, and
separated from free linkers by Centricon 100. Then, the
cDNAs were amplified by long-range high fidelity PCR using
Ex Taq polymerase (Takara) with a primer Sal4-S. The
products were double digested with NotI and SalI enzymes,
then purified by phenol/chloroform and centrifuged 100. The
cDNA mixture was subjected to a special subtraction
procedure by Dr. Kazuhiro Kondo at AIGIN Cosmos. Then the
subtracted cDNAs were cloned into SalI/NotI site of
pCMV-SPORT6 plasmid vector. The DH10B E. coli host was
transformed with the ligation mixture by the standard
chemical method. The average insert size is about 2.2kb.
The library was constructed by Yulan Piao and Kazuhiro
Kondo."

permitting clone movement to new vector backbones for
expression in diverse host cells using recombination
rather than restriction enzymes. poly(A)+ mRNA was
prepared by Invitrogen, and equimolar amounts of RNA from
each of the 12 tissue samples were mixed together for
selection of mRNA with a 5' cap. After synthesis of cDNA,
a normalization step was conducted against the mixture of
RNA sources. Tissues prepared: 1. just emerging silks; 2.
inner husks from ears of sample #1; 3. 20 day aleurone; 4.
immature tassels, stages from 1-2 mm to 1-2 cm; 5. 2 mm to
2 cm ears; 6. pollen; 7. 1 cm vegetative shoot tips from
15 day old seedlings; all leaves with an expanded or
partially expanded sheath were removed; 8. mature leaf
tissue; 9. 0.5 cm long root tips from 15 day old
seedlings; 10. 10 day whole seed; 11. 12 day endosperm and
embryo; 12. 7 day endosperm and embryo. All of the
sequenced clones in Maize Full-length cDNA Project will be
archived at the University of Arizona. Clones, high
density filters and amplified library can be ordered from
the University of Arizona
(http://www.genome.arizona.edu/orders/)."

This is a Gateway compatible vector, permitting clone movement to new vector backbones for expression in diverse host cells using recombination rather than restriction enzymes. poly(A)+ mRNA was prepared by Invitrogen, and equimolar amounts of RNA from each of the 12 tissue samples were mixed together for selection of mRNA with a 5' cap. After synthesis of cDNA, a normalization step was conducted against the mixture of RNA sources. Tissues prepared: 1. just emerging silks; 2. inner husks from ears of sample #1; 3. 20 dap aleurone; 4. immature tassels, stages from 1-2 mm to 1-2 cm; 5. 2 mm to 2 cm ears; 6. pollen; 7. 1 cm vegetative shoot tips from 15 day old seedlings; all leaves with an expanded or partially expanded sheath were removed; 8. mature leaf tissue; 9. 0.5 cm long root tips from 15 day old seedlings; 10. 10 dap whole seed; 11. 12 dap endosperm and embryo; 12. 17 dap endosperm and embryo. All of the sequenced clones in Maize Full-length cDNA Project will be archived at the University of Arizona. Clones, high density filters and amplified library can be ordered from the University of Arizona (http://www.genome.arizona.edu/orders/)."

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

US-09-925-065A-906221/c
; Sequence 906221, Application US/09925065A
; Publication No. US20050228172A9
; GENERAL INFORMATION:
; APPLICANT: Wang, David G.
; TITLE OF INVENTION: Identification and Mapping of Single
; FILE REFERENCE: 108827.135
; CURRENT APPLICATION NUMBER: US/09/925,065A
; CURRENT FILING DATE: 2001-08-08
; PRIOR APPLICATION NUMBER: US 60/243,096
; PRIOR FILING DATE: 2000-10-24
; PRIOR APPLICATION NUMBER: US 60/252,147
; PRIOR FILING DATE: 2000-11-20
; PRIOR APPLICATION NUMBER: US 60/250,092
; PRIOR FILING DATE: 2000-11-30
; PRIOR APPLICATION NUMBER: US 60/261,766
; PRIOR FILING DATE: 2001-01-16
; PRIOR APPLICATION NUMBER: US 60/289,846
; PRIOR FILING DATE: 2001-05-09
; NUMBER OF SEQ ID NOS: 957086
; SOFTWARE: FastSeq for Windows Version 4.0
; SEQ ID NO 906221
; LENGTH: 600
; TYPE: DNA
; ORGANISM: Homo sapiens
; ORGANISM: Homo sapiens
US-09-925-065A-906221

Query Match      75.8%; Score 18.2; DB 5; Length 600;
Best Local Similarity 87.0%; Pred. No. 1.4e+02;
Matches 20; Conservative 0; Mismatches 3; Indels 0; Gaps 0;
